3710. Re: Mods for YAESU FT 840 needed

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-02 00:00:00 UTC
From: nadzam@garlic.com
Message-ID: <47aid2$jvo_001@nadzam.garlic.com>
Source record: 210664

Well guys i see that many people have been looking for mods for
this radio so here is the out of band tx mod.

1. take off bottom and top covers.
2. connect a jumper from point TP2003 to ground. this is temporary
while preforming the programming steps. that point is in front and to
the edge of the lithium battery.

3. with the ft-840 off, press and hold the (SSB) & (AM) buttons at the
same time. turn on the rig, then release the buttons simultaneously.

4. the display will show (02-ON). press the (AM) button to confirm
setting: it should read 7.000.00 LSB. turn rig off.
(If the rig does not show 02-on move the main freq knob to change it)

5. press and hold in the MEM , (DOWN) and (UP) buttons while turning
rig "on".
6. turn pwr off, and remove jumper.
7. if you have a problem, dump the backup memory by switching the back
up switch off per the manual.you can then redo the steps.

If you know of any mods please let me know and if you can find out what
01-ON/OFF to 09-ON/OFF i think it goes to, what do the other settings
do.

TS-850 Separate Receive Antenna Modification

On Wed, 1 Nov 1995, Larry Pardue wrote:

> I have a buddy (N5DM) who has been trying to decide between the 850 > and 870. He would like to get an 850 except for the lack of > provisions for a separate receive antenna for 160 meter use. I have > checked all the mod lists for the 850 and have found no mod that would > allow the use of a separate receive antenna. Has anyone done such a > mod or has anyone heard of anyone else doing it? You could reply on > the group, or to me at discus@caverns.com (NU5M) or to Paul Elliott > (N5DM) at st_pelliott@beta.nmjc.cc.nm.us. > > 73 Larry (NU5M)

The following mod was developed by WA3WJD:

Make a short loop of white telfon cable with a male and female BNC connector. Loop it out of the back of the rig so just enough of the coax sticks out so the BNCs canbe joined with a barrel connector. Locate the little header connector onthe filter board in the TS-850 that is on the receiver side of the TS850 antenna relay. Pull that connector loose. Spend a little time tracking down male and female header connectors that match what Kenwood uses.

Install those on the ends of the white teflon coaxes sticking in the back of the radio. For normal use, just connect the BNCs with a barrel connector and the rig is normal. For Beverage use, connect an extra antenna switch common and ant #1 to the BNC connectors, and put ur Beverages on the other positions.
73, Brian WA3WJD

Hi. I currently use a Kenwood TM241A, with a 5/8 magnet mount on the car, and a very small 2m beem on the house, about 35 feet off the ground. I am fed up! I am mainly tired of overcrowding, and incredible amounts of intermod almost everywhere!
How much is 440 MHZ used these days? When I had a scanner years ago, I thought it was quite dead compared to 2m, but things may have changed. Also, assuming all variables are the same (ie. putting out 45-50 watts to 5/8 antenna), what are the performance differences between the two bands? I may escape the intermod by switching to 440, and be able to have higher gain but smaller antennas then those on 2m, but do the bands perform radically different from each other?

Anybody with any thoughts on this matter?

Thanks,
Chris.

Subject: RS HTX-202 questions (intermod, batts)

>>Does the HTX-202 have good intermod rejection.

Yes - an excellent performer. You will not be disappointed.

>>Does the HTX-202 accept "classic" ICOM battery packs (I have BP-3,
>>BP-7, BC-35 charger, etc., and I'd like to be able to share
>>accessories).

Absolutely. Mikes and headsets are compatible, too!

>>What's the output power with the stock battery pack?

2.5 - 3.0 Watts.

>>I gather it would make more output when powered from 12VDC.

Yes - closer to 7.5 Watts. Some claim a tad more!

>>Is this recommended?

The unit WAS built for it!

>>Is a compatible (12V) battery pack offered from someone?

Periphex makes a nice one - but it practically doubles the size of the
HT! <grin>

>>Can you run the HT directly from 13.8 VDC thru a cig lighter...

Absolutely!

>>...will the BC-35 charge the 12V pack properly?

It does with my Periphex 12VDC Battery. Check with your vendor!

>>Any other words of wisdom from HTX-202 guru?

A solid, proven performer. Performs as advertised.

A few answers:
1. USB is the mode of comunication for 6m just as it is for 15, 10 and 20. Just one of those established things..
2. There are now available separate SWR/Power meters for 6 meters. They are made by MFJ.. As far as I know, you cannot get a SWR meter made for 2m, HF or 432 to properly measre anything for 6 meters.
3. Listen on 50.125 (national USB calling freq.) and when the band is open listen down from there (for overseas stuff)
A great book on 6 meters is called "6 Meters The Magic Band" available through WorldRadio Books or your favorite ham store.
See ya on 6

Date: 1995-11-02 00:00:00 UTC
From: myantach@moose.uvm.edu
Message-ID: <4798sk$hj0@swen.emba.uvm.edu>
Source record: 210742

If anyone is familiar with the 79A(D) mods, please let me know. I recently moded my radio for the extended receive, and it's giving me wierd limits. Instead of the typical (at least for the 79A) receive of 69-174 and 400-511, I get values of 118-174 and 410-469. I have reset the entire radio, and the VFO itself. Is there something that I'm missing? I have not preformed the MARS/CAP mod, because I'm not sure that I was supposed to do that in addition to pulling diodes 304 and 307.
Did they change that with the Deluxe model, or do I need to do something different?
Thanks ahead.
73,
N1RII

I have the spectrum anal/track gen 8028/8038
Dont expect performance of a good HP analyser, but I think the
unit price/performance is good.
I only worry about service/spare parts.
I have a deffective cable which connects unit to the scope.
A funny BNC lookalike connector on this cable is deffective and it seems
to be impossible through the Dutch distributer to obtain a new cable or
connector. (airparts in alphen a/d rijn)

Chuck, one of the problems with DSP filters for VHF FM Packet
is their bandwidth. They typically top out around 3 KHZ and
that has proven problematic for 1200 baud signalling rates.
They do however work well on VHF FM voice with a small trade
off in fidelity. Living in an old inner-city neighborhood, I
can honestly tell you that no audio DSP can help you much when
line noise levels approach S-7 or greater on HF. Mine often
gets as high as 10 over S-9 on 80M. That's when it's time to
go spend some time with the family. I know this is of little
concillation, but wanted to share my experiences with you.
Good Luck resolving your noise problem and 73

3720. 1.2 Fm or 430 am atv w(1)

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-02 00:00:00 UTC
From: n0nas@hamlink.mn.org
Message-ID: <815300063.AA04088@hamlink.mn.org>
Source record: 210745

to: nv7v@burgoyne.com
Hi Steve.

NV>Our local group is getting involved with using ATV for public service.
NV>I am thinking that 1.2 FM would work best with portable equipment
NV>rather than using 430 Mhz.

Our RACES group also uses ATV at some events. First, DON'T rely on 439 MHz ATV for anything. In any real event you'll probably be surrounded by 450 MHz radios and some of your own 440 MHz HTs. They will destroy the ATV picture and ATV will interfere with them too.

So now we have 910 or 1200 MHZ and AM vs Fm. 910 MHz AM has the advantage that you can probably tune most "Rabbit" type TV extenders to receive the picture. A few TVs may be able to tune it directly too. This makes 910 MHZ AM possibly useful for distributing the signal. I forgot to suggest 427.25 MHz AM for distribution. It can be received on channel 58 of any cable ready TV or VCR. Again, use it for DISTRIBUTION of your TV signal. Almost forgot, the 910 MHz system could be interfered with by the newer 800 MHz trunking systems and Cellphones too. We haven't seen too much problem yet in our area.

I really prefer the FM systems. Assuming you get enough signal for FM capture, you will have a better picture than a similar signal level in an AM system. The problem is all the FM receivers I've seen are TUNEABLE. And when they loose frequency lock you have to manually tune them back in. I REALLY want to see a crystal controlled FM ATV receiver. Another option we will be trying is to use an old satellite TV receiver, one of the "block" converter types. Most of them are really synthesized FM TV receivers that cover from 950 MHz to 1450 MHz, nicely covering the 1200 MHz band. A few of the local ATVers are using them to receive the local 1200 MHz FM ATV repeater output using a preamp at the antenna. They say they get better pictures than from the 421.25 MHz AM repeater output.

So, my suggestion is to use FM ATV from the camera to the RX control site and 427.25 MHZ AM to retransmit to local TVs at the control site. Absolutely nothing wrong with using standard channel 3 or 4 outputs from a VCR and cable it to local TVs. Or the "Rabbit" and 910 MHz AM TX system I mentioned before. Using horizontal polarization for antennas may help reduce interference. Consider the "Little Wheel" antennas.

On the subject of antennas, we tend to select an omni directional antenna at the RX site and either omni or beams at the TX. ATV requires a LOT of power to cover any distance at all. If you have line of site, yes you can use lower power. But if you have any trees or buildings in

the way, you're sunk. Most of our call-outs with ATV are for fire scenes or barricaded suspects. We have to go less than 1 block and probably over a house. The system we use most is the 910 MHz AM 10 watt TX thru 20' of 9913 to a Comet gain vertical at 15' on a extendable painters pole. Optional antennas are 30" loop yagi beams. The reason we use the 910 AM is because it has a crystal controlled receiver.

Last summer we attempted a multiple hop link. We used 910 AM from the camera 500' to the RX control point, TX via 1200 FM about 1 mile down the street to a transfer site. Re-TX via 900 FM another 1/2 mile to City Hall. The 1200 FM link was basically straight down the street lined with trees on each side. The 900 FM link was through some houses and a lot of trees. The 910 AM short link was crystal controlled and perfect the whole time. The 1200 FM link could usually get a good picture but was greatly disturbed by cars and trucks driving down the street. We had a marginal picture on the 900 FM RX just once. The basic trouble was too many adjustments in the transfer site; 1200 RX freq, video and audio out level, 900 TX video and audio input levels. It was darn near impossible to get things adjusted right and if by chance you did, a truck would go by and cause the RX to loose freq lock. It was VERY discouraging. We even tried to go direct on 1200 FM but with the antenna mounted on a 40' mast lost amoungst 60' trees, a church directly in the line of site, and trying to tune the RX, we couldn't get anything at all. That's why I keep harping about crystal control receivers and minimum adjustments in the RX/TX system. If you find a good cheap video automatic gain control and sync restoration circuit, be sure to let me know. I'll use it the next time we try this stunt.

We did have one very good experiance with feeding flood water pictures to the city EOC. This was the second year we had the 910 AM gear. The camera and TX was moving around the streets and bridges downtown around the river. We put the 910 RX on top of the post office a block off the river. We contacted the local cable company and got one of their video modulators and connected our video into the cable company city government cable and had the cable company put it back on the cable for the EOC. They actually put it on the regular consumer cable system too so city residents could watch the flood too. One thing the cable company wanted was a stable video "squelch" to blank the screen when the camera signal went away. Contact the cable company early.

I highly recommend you use a CW or voice IDer and auto timer on the camera for ID. DON'T rely on the camera video titler. Somebody has to keep programming the thing. I think QST had a cheap CW IDer based on the PIC16C54 chip that had a "fox hunt IDer" mode. That is the one I'd

****** NO PROBLEM __ ONLY OPERATOR ERROR!!!!!******
****** THOUGHT IT WAS IDENTICAL TO TO MY KENWOOD TS-50/TH78 - Sorry !!!
NO PROBLEM, HAD TO READ THE MANUAL CLOSER, APPARENTLY THE IC-706
, AFTER PRESSING SCN, THE UNIT SCANS ALL CHANNELS IN MEMORY, THEN
PRESS SEL WHILE ITS SCANNING, AND IT WILL ONLY SCAN THE CHANNELS
FLAGGED WITH THE S SYMBOL
Date: 1 Nov 95 22:17:18 GMT
From: aust@gandalf.sp.TRw.COM (Mike Aust)
Subject: IC-706 Rig Selective Scan Memory Mode Problem

Attn: IC-706 Users:
Has any one had any problems with the Selective Scan Feature on
Memory Channels.
I programmed in 6 VHF-FM simplex frequencies into my IC-706, in
memory channel locations 1 thru 6. Then went back to to the G2 menu,
and pressed SEL while in Memory Channel Mode, This created a small S
to appear next to each channel I did this to.
I did this with Ch1,Ch2,Ch3, and Ch4, creating the Flagged S symbol
for these channels. I left Ch5, and Ch6 with no Flagged S symbol.
Next I pressed SCN for scan and the IC-706 scanned all 6 channels,
when I expected only 4 channels to be scanned.
Did I do something wrong here or is it a bug in the firmware, can
anyone confirm this, or at least tell me to go back to the manual??

Don Johnson,W6AAQ 26659 Caspay St, 95627-0595 was the orignal designer of this antenna, and I've heard that he may have legal action out on the people copying his antenna.

At one time, for $5.00 Don would send complete information on how to build the screw driver antenna. It about 16 pages long and covers the making of the antenna from start to finish. He also has writren two very good mobile antenna books.

In my estimation, mounting the antenna is were the people selling it, are worth looking at. The antenna's mounting bracket may take some real thought depending on what you mount it on. Most of the antennas I have seen have the plastic tube taken off the coil and a rubber type motor cycle shock absorber cover over the coil. This seems to work quite well.

It you have this antenna you don't need an autotuner on your rig.

Good Luck
Jim, WA7NDD

Seems like a neat application. Would be great if you could submitt a
short description to the L.O.S.A when finished.

List Of Stamp Applications (L.O.S.A for short)
==

If you have done something with the BASIC Stamp (big or small)
that you are willing to tell others please use the form below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Then e-mail the form to:

cj@algonet.se

With the following as the subject:

L.O.S.A Contribution

Or you could point your Web-browser to the following URL and fill in
the L.O.S.A form on the Web-page...

http://www.algonet.se/~cj/losa.html

When there are a bunch of contributions I'm going to post the L.O.S.A
to this list, upload it to Parallax, Inc. FTP-site and send it to the
following Usenet groups. I will update it approx. once a month.

sci.electronics
comp.robotics.misc
rec.radio.amateur.homebrew
rec.radio.amateur.misc

[--- cut ---]

```
============================================================================

The IC-706 has a *wideband* FM receive mode, hold the mode button for 2 seconds when you're in narrow FM mode and it switches to WBFM. To deal with overload, I just switch in the 20 db attenuator. Works fine, but it's not stereo. That *must* be fixed!! :-)

I don't want to teach a dog to suck eggs, Gary, but the manual says
that initial set mode item 24 can set the radio to use 4-byte or
5-byte frequency words. Isn't this transceive? Or perhaps it only
works one way, IE from the IC-706 to the IC-735.

BTW, I think it sucks to ship a radio with no schematic, or even
block diagrams. When will the service manual be available?

Gary

I am looking to buy a wireless communication device
that can transmit over 150 miles (250km). It cannot be a cellular
phone since the infrastructure for cellular phone is
not available. The requirements are for point-to-point communication
over long distances. Security issues have not been decided.

What kind of device will solve my problem?
If radio, what type of Radio communication device will suffice?
How much will this cost?

Please reply to rguha@bnr.ca since I usually don't frequent these
newsgroups.

[snip, 'cause my provider can't stand quoted text.. :( ]

Well, I have a nice FT-301D with the FC-301 tuner, and FP-301
speaker/power supply, and for old stuff, it works pretty well.
The only gripe I have is with the LED display - the highest order
digit is intermittent. The tuning rate is also a little fast for
working RTTY/PACTOR etc, but that MAMMOTH heat sink on the back
more than compensates for it.

Considering it's age, it's still a great rig !

Hi Matt:

In regards to the Motorola Radios: the line goes as follows:

JEDI = HT1000, MT2000, MTS2000, & MTX Trunked Radios.

SABER: Saber I, II, III

ASTRO SABER:

There are dealers in your area that sells JEDI & SABERS USED.

I think what you need to find out first exactly what frequencies, Private Line/ Digital Private Line is used, and be sure that the system is NOT trunked or ASTRO.

E-mail me at BK104@HGEA.ORG with specific questions and I can try to help you. Motorola Software is priced at $350.00 for each radio type.

Each radio requires a programming cable. Cost for this varies. You would also need a Radio Interface Box (RIB).

Can't give you a est cost of a used radio without more specific information. Estimated cost to purchase equipment needed to program radios is about $600.00 alone.

My recommedation is if you are serious about MOTOROLA Radios, look for a reputable dealer in your area.

: Are you implying that you heard WIDE BAND FM through the 706's narrow
: band FM receiver simply by changing the antenna?

No. It has WBFM position. It works ok but strong fm stations tend ot
overload it. A smaller antenna obviously would help prevent this.

3740. Changing lithium batteries in Yaesu FL-7000 amp/autotuner

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-03 00:00:00 UTC
From: pruth@ocvaxa.cc.oberlin.edu
Message-ID: <47d8jp$7b8@news.cc.oberlin.edu>
Source record: 210680

Has anyone ever had the opportunity to change the lithium batteries in this beast? There's one in the amp section, and one in the autotuner section, and I'm about to tear into the device and change that which needs to be changed. The batteries are on their way from Yaesu, and the tech support guy from Yaesu told me over the phone how to do it, and it sounds rather hairy, especially for someone such as me who has a Klutz Index of 87.3. It would either reassure/terrify me to hear what others have experienced in this regard, and get the caveats I need. Thanks. --Bill kb8usz pruth@alpha.cc.oberlin.edu

You are absolutely right. Below 60 MHz it is fine, but above it is nearly useless. Even with a 1m whip you can only hear intermodulation from FM band. All the way from 60 to 200 MHz, if the preamp is on. The 50 kW FM stations are about 10 km away.

NBFM is a bit better than the wide FM. On the East European FM band (66 to 73 MHz) I can hear a few Estonian stations on NBFM but on WFM it is just noise. That is with external antenna and preamp off.

> Call me wierd (I know some of you do anyway), but what closed the

Gary, when you get at it, look if the front end could be improved also. And let us know. It shouldn't be too difficult, my 50$ walkman does a better job on FM.

Otherwise the rig is almost perfect for me. Well I wouldn't mind 100 W on 2 meters or configurable RF connectors. Or at least a different "band" voltage on 2 and 6 to control an external relay.

Does anyone have interest in developing an external automatic antenna switch/filter bank/preamplifier ? CI-V bus interface, controller and a few relays and connectors.

>The following mod was developed by WA3WJD:

<<snip>>

I hadn't realized until now that new transceivers were being made without a separate input for the receiver. I'm planning to upgrade shortly and have been thinking about the TS-850 because of its QSK capability (which my present transceiver doesn't have). However, my station includes a KW amplifier and I had intended to add an external T/R switch for QSK when the new rig arrived. The switch I have in mind requires a separate connection to a receiver and is essentially an electronic version of a SPDT relay, switching the receiver input between ground and the antenna.

Assuming that I don't want to modify the new rig or use vacuum relays, is there another configuration of T/R switch that's normally used for QSK with transceivers and external amplifiers? If this issue is a dead end, can someone recommend a similarly-priced transceiver that provides good QSK and a separate receiver input?

73 & Tnx,

Jack WB3U

I recently purchased and Icom V68 handie talkie, and I believe that I was mis-informed about this radio prior to purchase. The salesman had told me that the radio was just a "plain jane" model, with minimal features, but that it also received 136-172 Mhz (pretty common with today's VHF rigs.) He said that it also is a good alternative for commercial use, kind of a "dual function" radio. He finally told me that a few security companies have purchased quantities of these radios for their employees.

Anyways, the price was good, so I purchased it, and ever since that day, I have become VERY frustrated with this rig. The manual tells me absolutely NOTHING about even the simplest features available on this rig, such as the + and - offsets, programming the memory channels, etc. Other information included in the manual is very vague, and hard to understand, and it keeps mentioning "If you are unsure...contact your system administrator or operator." Yes, I guess this more a commercial radio than amateur, even though I have seen this rig advertised in some ham magazines. To prove this point even further, the advertised "136-172 receive" is actually full transmit as well, with absolutely no modifications needed-it comes like this straight from the factory!!

Well, enough babbling for now. I would just like to know if anyone has any experience with these units, such as programming them, and getting all of the features to work that are not in the manual.

Thanks in advance...
Jason.

3749. IC706 CW Filter ??

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-03 00:00:00 UTC
From: n4lq@iglou2.iglou.com
Message-ID: <DHHK1C.7zs@iglou.com>

Does anyone know how many poles the FL-100 cw filter has? Is the skirt comparable to that of larger rigs? I just recieved the filter and it is awfully small to have many poles in it. It says 6db on it.

Lew McCoy's review in November QST was much more complimentary to TS870 than what I have been seeing here in this newsgroup. He did NOT compare the receiver against (say) a TS850 with an audio DSP, so we still don't have apples and apples comparison relative to the comments here.

Suggest you read and judge for yourself.

I'm debating on modifing my Yeasu FT51R. I have the directions of enabling the 420-470 rx/tx 140-?? tx.

Are these jumpers that are to be removed, solder or actual wires? Can they be cut rather than taking a soldering iron to the board?

Anyone who has done this mod, if you could please share your comments with me I'd appreciate it.

>I rigged a momentary switch to ground TP17 thru a 1k resistor (you never
>can tell) and it works just fine! I drilled a small hole to mount the >switch
>just above the plastic depression so I could push the button with my >right
>thumb. A small toggle switch would fit if you want to hold longer.

I just finished this mod. Works great! I put both a momentary switch on
the side as well as a toggle on top (very tigh fit on top). The toggle
was a little too long on the side for my tastes, so I put a
momentary in the side hole and moved the toggle to the top (Just in
case I need to set the thing down while still showing the freq.) Thanks
for the info. :-)

Source record: 210699

I have an OMNI VI that was built early this year. It does not exhibit any problem with the QSK at 35 wpm or higher, and the sidetone is fine. The noise from the reed relay is really very light and high pitched, easily ignored. (I have a few ways to quiet it down and I am satisfied that when I want to, I will make it very quiet...)

I would need to hear a better description of your problem to understand it. I would be happy to correspond on the subject.

3761. Re: IC-706 HF Rig Features

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-04 00:00:00 UTC
From: "Gary P. Fiber" <gfiber@halcyon.com>
Message-ID: <47g213$g8c@news.halcyon.com>
Source record: 210604

The adjustment for 4 bit data is for connecting the 706 to a 735 using one for the receiver and the other for the transmitter, and allowing them to track each other. It is called transceive mode in the CI-V world of things. One might try setting the 706 to the 4 bit data and see if a 735 control program will work. But there are many fine programs that also cover other models along with the 735.

The service manual figures to be available some time after January, 1996. Leaving out the print is a cost cutting measure, also aloows for putting in all efforts to service manuals. If you take $ 0.50 per print and multiply that by 20,000 radios it gets to be a fairly pricy sum of money. Money that is better spent for service manuals. Far better than not printing service manuals at all.

In todays radios it is pretty hard to identify and find one's way around with out some sort of circuit board layout. The layouts will be in the service manual.

Experiment with the preamplifer OFF

I find my 706 works very well everywhere but I notice that if you are not in a HAM band, the preamplifer does funny things. It seems to distort the signals.

Try this experiment on 2 meters. With the preamplifer off, Tune the band with the squelch off and tune past a band edge. No significant change will be noted. Now do the same thing with the preamplifer on and notice what happens as you tune the band edge. The radio beeps as you cross the band edge and the noise become incredible.

I also noticed that on the 118 mhz airport advisory channel, the signal is great with the preamplifer off. But with it on, the signal becomes very distorted.

However the preamplifer works like a champ on any ham band particularly on 6 meters and on 2 meters.

So, it appears to me it is somehow programmed and out of band has something else put into the circuit.

The reports of poor sensitivity need to be rechecked to see how the preamplifer was set.

I love my 706 - it's a neat radio with the only drawback on programming 2 meter repeaters. It wants to act like a HF radio with the memory management.

73's all

3776. WANTED INFO: How to build modems.

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-04 00:00:00 UTC
From: mutchg@topaz.cqu.edu.au
Message-ID: <1995Nov4.101435@topaz>
Source record: 210619

Hi all
I'm chasing schematics or circut diagrams/proofs full designs
what ever , to make modems, phone modems , fax modems packet tnc. etc...
Can anyone help in this area. I wish to build telecom approved modems
in the not to distant future. I have a pet project: I would like to
program multi port software and I think purchasing volumes of modems
may get expensive. So I'm waying up the option of building them myself.

Any replys with schematics for Australia preferably , if not anything will
do . I can add modifications I guess.

I'm new at the modem game so go easy on the any details :)

3777. HELP PLEASE - MOTOROLA MX30OR INFO & PARTS

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-04 00:00:00 UTC
From: lmilrad@passport.ca
Message-ID: <47h1mp$7a0@diplomatic.passport.ca>
Source record: 210620
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

I have a chance to acquire a set of Motorola UHF MX30OR 12 channel radios (Model H44SXU3140AN) which are medium sized units with a black rubberized finish. Two problems - firstly, I'm not familiar and never seen nor heard anything about these models and secondly, neither has an antenna nor battery.

Any input regarding these units would be greatly appreciated as well as suggested product numbers for the antenna and battery packs. Both are in the lower 440 MHz split.

Thanks in advance.

lou these are very rare units by most standards..they were typically sold to the us govt agencies ie coast guard, dea etc. they are really mx300-s inside with some minor differences..case parts are limited availabilty and u best have the us mint in your pocket...bad thing was that the rubber rots..especially in the sun.. i have several of them myself and have all the spares (inside) that u might need..lalso have a rare converta com for one..

In article <DHH5x2.CAx@eclipse.sheridanc.on.ca>, jason goldring
<jason.goldring@sheridanc.on.ca> says:

>Jason.
>
Sounds like a comercial radio, which means generally no VFO,
very fast scanner, better reciever performance than amateur (intermod),
a manual written for idiots, and no amateur only features like "offset".

Comercial gear usually handles duplex (repeaters) by designating a
seperate transmit and recieve frequency in programing. In fact some even
require the transmit and recieve to be programed for simplex. In most
cases, recieve only can be set by programing a recieve frequency and
leaving the transmit blank. Some of the features and programing are going
to be different than the way your used to thinking about them.

Usually what you get is a scanner with a real priority which works in
the scan list, *probably* a better reciever, and heavy duty construction.

If this radio was represented to you as a *amateur* radio, then it
was probably mis-represented. However, I don't think it was as you
report the salesman said it was sutible for comercial use, therefore
implying type acceptance. Amateur gear is usually not type accepted
in the form it is marketed to amateurs. There is nothing unappropitate
about using comercial gear on amateur frequencies, and it sounds like
the salesman gave you a inexpensive alternative (if the price was as good
as you say it was).

If there is a comercial shop in your area that deals with ICOM, they
can help. Most modern comercial gear is programed with software on a PC.
There usually is a way to field program radios of this type that is not
openly advertised, or stated in the manual.

Jg> Expanded frequency coverage is a compromise. If I want such a
Jg> compromise, I'll buy a cheap Radio Shack scanner. I'd rather not made
Jg> such a compromise with my ham gear.

Exactly! I have a Kenwood 241A. Sure, it gets 118-174 MHZ, but about
65-70% of the repeaters I'm interested in on 2m get wiped out by intermod.
I plan on completely switching over to 440 mhz, as most of the locals in
my area have done.

>
>73 Larry (NU5M)
>

I haven't actually made such a mod, but from poking around in that area of my '850, I can see where it'd be pretty easy. The RF comes into the receiver board at a connector marked RAT (receive antenna, I suppose). It's not a standard connector, but a little ingenuity would allow one to add a separate wire out to a separate connector. The board is on the bottom of the unit, and the connector is under the shield at the back of the board. The RAT connector is right next to the back edge of the board, right next to the back side of the cabinet.

Email me if you need more info.

I have the HTX212 myself. This is not a bells and whistles type radio
but one nice feature is true FM rather than phase modulated. The radio
uses Motorola chips and is manufactured by Maxon. 30 memories with any
offset and separate tx and rx PL's. not great on the lockout feature,
can only do 5 lockouts.

In rec.radio.amateur.equipment you write:

>speeds (30 wpm) is really no fun, for I have a "blobbing" which makes
>it impossible to hear through. It is even impossible to hear the
>sidetone. If I change the passband tuning the blobbing gets less loud,

Now, what is this "blobbing"? I got on the SS contest with lots of strong signals, and set the keyer to well over 35 wpm, and I DO notice some rushing with the AGC trying to catch up between transmissions during QSK. It sounds like the attack time needs adjustment. It is an intermittent "popping" maybe, while the strong signal is present in the passband of the receiver while I am transmitting. I just fiddled with some AGC components anyway, and will now probably do some more.

>but then ... Beside that the klicking of the relais is in my ears
>very loud. I was told, that this is a problem of bad construction,

I don't understand. The Reed relay is loud enough to bother you? It bothers me, too, but not enough to ruin my day. I am going to either get a quieter relay, or suspend the relay on some softer wire and encase it in silicone cement (ammonia based, not acid based), or both. I suspect I can make it very quiet. Then, there is the possibility of building an electronic t/r board to slide in there, there is room.

>There were discussions about replacing some resistors to get a
>less 2. IP products. I wrote to Ten-Tec and they said that they have
>some modifications but forgot to send details. Is there somebody out there
>to post these mods ?

Oh, yes, on models built before last year sometime, you can do that. I don't know the details, you will need to drop a note to Ten Tec about it, they will write back, I am sure. Make sure you let them know you need that info again.... You can also use PIN diodes in the bandpass filter circuits per the QST articles on receiver design. Probably you ought to do both (unless your unit already uses relays in the BPF board, which some European units do, much better than any diode switches!).

From: eae@netcom.com (EalesOnWheels)
Subject: Value of donated equipment?
Message-ID: <eaeDHJzKL.K5w@netcom.com>
Organization: NETCOM On-line Communication Services (408 261-4700 guest)
Date: Sun, 5 Nov 1995 04:38:44 GMT

This is not an advertisment - more an appeal for help with some donated equipment. At a school fundraiser garage sale we had a receiver and transmittter donated with the proviso that we ask $100 each for them.

They are Yaesumusen models FR-100B and FR-200B.

Could anyone advise us on what it is exactly we have, what might be it's resale value and whether the equipment (given that it is in working order) might be of interest to a radio hobbiest at any price.

Our options are 1> To return them and say no thank you

2> To negotiate a different "hold" price with the owner

3> To offer them in a different forum than a community garage sale

Any advice or comments would be most welcome - especially at my e-mail address eae@netcom.com

Thanks in advance

Eric

YAESU FT-5100 Beep ON/OFF

Here is what you do to turn the Beep ON/OFF.

- Press the [F] then [TONE] button, then press the [F] again to turn
the beep on/off.
- Press the [TONE] button again to save settings.

My friend Tom N0QNY recently bought a Ge master II 440 repeater. The problem is that he has been unsuccessful in tying in a controller or an IDer.
We know we must tie in the inputs before the Pl circuit but cant figure out where.
Please drop us a note if you know anything these repeaters. We would love to put this unit into service ASAP.

Charles,

I doubt that a DSP filter will be of much help. You really
need to go after the noise at its source, Just calling the
power company probably won't get much of a response either. What
I suggest is that you get a copy of the "Interference Handbook" by
William Nelson, WA6FQG. He describes what causes various types
of electrical noise and how to locate them. I have suffered from
electrical noise and know how you feel. I am active on moonbounce
where even a small noise can mean no contact is possible. Once
I have located the pole the noise is coming from I have had success
in getting the power company to come out and fix the problem. For
what its worth most of the noise sources I have located come from
neon signs on business where I've had little luck in getting
cooperation. One finally got fixed only because the sign quit
completely and they had to get it fixed. I lucked out and happened
to drive by while it was being fixed. So I stopped and talked to
the repair man. He did not believe me that the sign could cause
interference to someone over a mile away until I told him the exact
hours the sign was on! Good Luck!

>
>E mail ----- charles.plunk@vdim.com

I've used two DSPs here, an NIR-10 and a DSP59+, and they are not nearly as effective as a good noise blanker built into the radio. Unfortunately, few FM rigs have a noise blanker, because the nature of the demodulator is to reject noise anyway, so the manufacturers feel one isn't necessary. Most of the time that's true, but not always, as you know.

My suggestion would be to not give up on the power company. They tend to move glacially, but with enough prodding, they will move. A few years ago I had a problem with a neon sign several blocks away causing terrible QRN here. The owner stonewalled all my requests to fix it until the FCC wrote him a letter stating that that kind of interference to a licensed amateur radio station was illegal. Fixo pronto! The same policy applies to the power company. Keep after 'em!!

Subject: 2-meter handi-talkie wanted

>>I'm looking for a good used 2M HT at a good price. Just a straight
>>forward HT that works perfectly, bells & whistles okay but not as
>>important as price.

How about these features...for less than $200. bucks:

-12 independently-programmable memory channels, plus one calling and
three priority channels.
-CTCSS encode and decode.
-5 watts minimum (7w typical) @ 12VDC
-3 watts @ 9 VDC or 2 watts @ 7.5 VDC.
-Low power setting for 1-watt output
-Power saver circuitry
-Memories store any offset, and any combination of CTCSS tones.
-True FM modulation (not phase modulation) for outstanding
transmit audio and best performance in packet service.
-In addition to DTMF dialing, there is 5-digit DTMF selective
paging (DTMF squelch).
-A five-number memory dialer that stores 15-digit sequences
for autopatch use or DTMF paging.
-Scan for either active -- or vacant -- channels, with
programmable scanning step of 5, 10, 20, 25, 50 or 100 KHz,
and upper and lower scan limits (for VFO scan.)
-FAST, 25 channels/second scanning.
-Selectable priority channel scan interval, every 4, 8, 12 or
16 seconds.
-Multi-function scanning lets you scan standard memories,
priority freq. memories, or a frequency range. Resume can be
after 10 seconds, when carrier drops, or remain on channel
(don't resume.)

And it's new - with a 1-year parts/labor warranty! Buy yourself a
Radio Shack HTX-202!

3819. Icom 706 - modified advertising!

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-06 00:00:00 UTC
From: aust@gandalf.sp.TRw.COM
Message-ID: <9511060005.AA12053@aragorn>
Source record: 210559

Gary,

Icom, like any other high volume manufacting output, tries, to
have more coomon parts to fit a variety of products to drive its
costs down.

The IC-706 does not utilize the 3GHZ frequency in its implementation
to operate its IC-706, but was proguced to put in 800-950Mhz cellular
phones, 2100 -2400 Mhz Celluar phones.

Just as computer manufuctuers need to drive cost down, the consumer
product maket is price sensitive. It does not make the IC-706 really
outperform, it allow Icom to drive their price down toward competitors,
What you see is the Celluar technology, thinking, being pushed in Icom
products, I have now seen an Icom Celluar phone, but I bet an Icom-706,
that this is the market Icom has targeted, hence the outcome flows into
some of its communication products for the ham band.

The PA predriver is used for HF, 6meters, and 2meters, while the Output
section is switched in for 160 - 6 meter operation.

There that use of fewer parts to build a radio. Thats how Icom can do it.
The celluar market is a 500 million plus dollar industry per year. I think
this is why Icom has invested in getting coomon modules, IC's etc in its
products.

Hopefully, you can see the logic here.

As a result, hams with their big boat achor of HF radio's are taking a
double take when they see the very small size of the IC-706. Next time
you see someone using a celluar phone, you can thank them for paying the NRE
(non-recuuring engineering). If it was just the ham market there, you would
be paying at least $3000 - $4000 dollars instead of $1250 for the IC-706.

As you said , Pretty slick rig!!

Have fun with your Icom IC-706, I really like mine!!

73
Mike

I believe you mean *byte* not *bit* above, but I follow what you are
saying.

>The service manual figures to be available some time after January, 1996.
>Leaving out the print is a cost cutting measure, also aloows for putting in
>all efforts to service manuals. If you take $ 0.50 per print and multiply
>that by 20,000 radios it gets to be a fairly pricy sum of money. Money
>that is better spent for service manuals. Far better than not printing
>service manuals at all.

I don't find this argument compelling. Certainly $0.50 difference for
a $1299.00 radio is not significant. I don't think many hams would
complain if the price were $1299.50 instead. I think *any* amateur
radio sold should be expected to include a schematic, if for no other
reason than an educational one.

>In todays radios it is pretty hard to identify and find one's way around
>with out some sort of circuit board layout. The layouts will be in the
>service manual.

Now this is true, and including board layouts, component lists, etc,
in the owner's manual might be excessive. After all, we know the reality
is that most amateurs won't go inside their radios anyway. Industry
practice is to unbundle the service manual from the radio and I accept
this. But $49.95 is a hunk of change. I'm sure you aren't losing any
money here such that you need that $.50 savings in the owner's manual
to keep Icom from bankruptcy.

We *would* know that if you shipped a schematic, or even a block
diagram, with the radio. I going to keep nagging about this. I
think its a bad habit for manufacturers of *amateur* radios to
get into, and hope we can nip it in the bud.

Unlike their HTs, this radio *will* go out of band, but unfortunately
you can't *store* out of band frequencies in the memories. It also
shows some intermod, not as bad as some radios, but it's not as clean
in this regard as their HTs. I believe it's built by Maxon, like their
HTs, but don't know this as a fact.

>meter repeaters. It wants to act like a HF radio with the memory
>management.

Yeah, it doesn't understand the shift conventions for the various
2 meter repeater segments. When you hit duplex, it only does the
one shift you have programmed in the initial set menu, either a
minus offset or a positive offset. It doesn't know we use negative
offsets below 147 and positive offsets above. Aggravating.

Boy am I hurt.. ;)

My 301D has the brick-on-the-back anyway, so doesn't qualify.
I use it for HF digital, because the brick has an *enormous*
heatsink, and doesn't overheat when I get windy. Which is often.
Or so I am told.. :)

Sounds like kerchunking to me. ;-)

There's a rule of netiquette that follows a generally good idea, "praise in public, criticize in private." Something like that could have been sent by e-mail instead.

So, in the interest of restoring a good example for the readership, I would suggest a change of wording from "loved by the old men" to "appreciated by the clubs he's done a lot of work for," speaking as a member of one of those clubs.

In general, in any club I've seen that's worth being a member of... when young or new members show initiative and interest, at least some members encourage them. It's interesting that it could look to an observer like being a "puppet". In Travis' case, when he was a teen he became an active member and got lots of encouragement. It seems that it must have done well since he's finishing up a successful one-year term as president of the West Valley Amateur Radio Association, a 200-member club here in Silicon Valley. (That position is more work than title.) And we have a new bunch of young members that I think the club is doing a good job of helping. (As I was writing this, I just heard on the club repeater that one of them, a 14-year-old Extra, just got his 50th state for his Worked All States award. I think I hear a QST article in the works...)

After I realized how much of a boost I got from the people who encouraged me when I was a teen, I've been convinced that there are big long-term benefits to encouraging teens when they show interest in a technical hobby, whether that be radio, computers, etc. In general I think Hams tend to do pretty well about encouraging the new and/or young Hams but there's also plenty of room for improvement. Everyone should do their part, even if you don't have time to do more than just act friendly to them. That helps too.

Hallo everybody,
Is there anybody who knows how to modify a Alinco DR-599E VHF-UHF transceiver (it's the European version of the Alinco DR-599T) to enlarge the RX range to the air bands and the civil bands in VHF and in UHF and to the 900 MHZ band?
Thank you, and, please, send the answer via mail because I cannot check the newsgroups so often:)

Message-ID: <47ktha$2oii@news.gate.net>
Source record: 210571

We have a complete Micor 100W base station. The transmitter tuned up fine
but it seems we have a high-split receiver and can not get the receiver
totune down to our frequency 144.51 mHz. Our Mastr-PRO is failing left
and right and since this repeater is the closest to beingready for
prime-time if anyone knows where we can get a low-split front-end OR how
we can modify the existing one for good sensitivity at the low end of 2m
please email me at leon@gate.net

We also has a MASTR-II repeater, which I would prefer to use, but it is
not converted over and I dont want to wait for xtals to come in at this time.

Any ideas welcome.

From: l38217@alfa.ist.utl.pt
Message-ID: <47l58c$7tq@ci.ist.utl.pt>
Source record: 210572

Hi
On the last Ham feast I've been to , I've experimented
the Kent Morse Key (the double paddle horizontal) and I loved it.
Nevertheless I still remember when (long before) I tried the Bencher
Paddle and I loved it too. Now my problem is to know wich one is
better than the other (if they are not equivelent) because I still
don't have any of them but I want to buy one I just feel a bit
confused about wich one to choose. The Bencher seemed more light
and sensible, but the Kent doesn't look so fragile and is much
cheaper.
If any one has ever had both (or have both) I would like to know
more about each one's advantages and disadvantages to help me choose!

thank you

>73
>
>Jeff, AC4HF

Jeff,
I have had an HTX-212 almost since they came out. It has a few quirks
that are just slightly annoying (You can't save out of band freq - like the
weather broadcasts in memory.) I have had no problem and it is very easy to
set up a repeater freq into memory. Even the odd splits (my home repeater has
a 1.08M split) are not a problem. It does CTCSS both directions out of the box
(Read no add-on board). It has good audio and a 30 memory selection is plenty
for me. You do have to "OPEN UP" the transmit and receive (it is still in band
however) to use many of the repeater that use a lower than RS allowed transmit.
I talked to customer service and their response was that it was intentional and
done to go along with a "gentlemens aggreement" on bandplan. The 10 watt low
is a little higher power than I would like and the 45 high power is fine. The
Squelch is a little wierd in the setting. 50% - 12 o'clock is just S1 on my
radio. It is very hard to squelch out a moderate signal.
All in all I would buy another for my wife, but I want to wait for the
rumored "dual-band" mobile (and give my wife the 2m unit!)

>1. Does the HTX-202 have good intermod rejection (like my old IC-2AT)? I
>don't need out-of-band RX, I _DO_ need decent intermod performance.

>2. Does the HTX-202 accept "classic" ICOM battery packs (I have BP-3,
>BP-7, BC-35 charger, etc., and I'd like to be able to share accessories).

1. The HTX-202 has probably the best intermod rejection of any 2 meter ht around,
as told by several other 202 owners

2. The only other icom pack that the 202 will accecpt is the BP-8, from what I
have read, it shouldn't be charged with the BC-35 drop in charger while the
battery is attached to the radio, if I remember right it affected the diodes
at the bottom of the radio, but I'm not sure

Yes you are correct on the frequency. Also note that you will need a third
overtone mode series resonant crystal. JAN Crystals down in Florida can take
care of you at a reasonable price. They have the specs for the Drake Line
Crystals. Check your recent QST or maybe some other magazine for the address.
It's somewhere in Ft. Meyers Florida. They work a four day week. This outfit
is the old "Texas Crystals" group.

Gary-

Excessive? I've become accustomed to finding at least schematics and board layouts with the Icom radios I've purchased in the past. Not being able to obtain an Icom service manual until later, is nothing new. However, the wait would be more bearable with a schematic and board layout in hand.

Fellow netters,

I just came across three radios and a compatible charger. The radios are Motorola MTX-900. They have a telephone keypad, 6 channel, ABC switch, and have the adapter and secret service ear set, rubber duckie 8" antenna. Also on the side of the radio there is the standard push to talk pad, a private response button and a button that has a telephone head set.

The model number is 673APA0237.

After I charged the radios and turned them on I got a steady tone. I take it that thus means I am locked out and the radios need to be re-programmed.

My questions are

1. Are these radios worth anything?

2. How much does it cost to have them re-programmed?

3. If I trade them or sell them how much are these worth?

4. What would be a good trade for this set?

Any help would be appreciated. I live in the WASH DC area.

Oh, I agree, Fred. In an ideal world, full documentation would be
included with the radio. But I realize that the industry trend is
to unbundle service information. I can accept that because few amateurs
actually service their own radios today, but I still think a schematic
is a must with *every* radio. If need be, I can puzzle out component
locations, but I don't want to have to reverse engineer the radio to
see how it is designed.

3854. Crystal Set Book Available Online

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-06 00:00:00 UTC
From: mike_h@ttx.com
Message-ID: <47m5kb$n5d@nnrp3.news.primenet.com>
Source record: 210594

Just a quick note to inform you all that we are now carrying "The Crystal Set Handbook" online at BookZone.

Here is a sample of the preface to give you an idea what the book is about...

"This book is written for crystal set enthusiasts, first time radio experimenters, electronics students and radio amateurs. I wrote it to encourage design, building, and experimentation. For too long now, we've become appliance operators; that is, we purchase and use electronic gear but we don't dig inside it. Our future depends upon regaining the ability to create, to understand, and to build"
-Philip N. Anderson

We carry books at BookZone that you might not find in your average bookstore because we carry books from smaller publishers who don't have the advertising $$$ to get carried by the chains.

I just wanted to let you know that the book was available. There is a much larger portion of the book online at the web site. Check it out at http://ttx.com/bookzone in the science aisle.

Message-ID: <47m7hm$8hf@newsbf02.news.aol.com>
Source record: 210595
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

You might notice if it always sounds like a pager or some other such tone is one of the intermod signals. Your HT will be more suceptible (sp?) than other radios as they are usually run with a much higher gain in order to hear signals with their small antennas. When you hook them to the outside antenna is when you run into problems..

In Albuquerque we have some paging transmitters in the 152 MHZ band that are running over 1000 watts and they cause a lot of trouble for lots of folks. I just bought a PAR electronics filter which is a notch filter and it works GREAT!!

Might check them out in QST and if your intermod is from pagers, I know that will fix a lot of your problems.

Adios
Jim

3m makes a copper based shielding tape to tape up the
gaps in the case. Readily available but I think I have
the ordering info at home if you can't find it.

Try to find a case with copper combs around the lips of the
case. Usually these are found on OLDER FCC Class B
PC cases.

Watch out for cases that have PLASTIC fronts that look like
metal. You may have to buy a copper based paint, (available
at high end electronic shops) and either spray the inside
of the plastic front or touch it up. (Some come that way
from the factory.)

For a good supply of cases, try looking in the weekly publication
call Processor. It has ads for all kinds of computers but
has a big focus on PC stuff. Subscriptions are free 800-334-7443.

Oh yea, try to change to high quality shielded cables.

> If any one has ever had both (or have both) I would like to know
> more about each one's advantages and disadvantages to help me choose!

I've used both of these, and IMO the Kent wins hands down. The Kent
has a wonderfully smooth feel and a nice heavy base. I've owned one
for a year now and I love it. OTOH, I think the Bencher is too light,
and I have never been able to adjust it so that it feels good.

I'm a little confused about your comment regarding the price: I've
seen the Bencher for $65 or so, while the Kent in kit form is $88.
Not a big difference, but the Kent is definitely more expensive.

3859. Heathkit SA-2040 Mod needed

Hi Walter, your best bet is to try any of the radio shops in Sim Lim Tower / Sim Lim Square. Take the subway to Bugis (I think it's stop E1) and it's about a 5 minute walk. Blazer Electronics is one that I've dealt with frequently. It's in the basement of Sim Lim Towers, #b1-22 Jalan Besar, S'pore. Phone is 2966944.

I have picked up quite a few items during the past years and always am quoted a decent price. Just be aware of model differences between the ones available in Europe/USA versus those for the SE Asian market.

P.S. Are you in Graz? I spent many days there back in 1988/1989 while studying at Ljubljana University in Slovenia. We used to go up to Graz for shopping all the time! 73 Joe

Date: 1995-11-07 00:00:00 UTC
From: mlapolt@netaxis.com
Message-ID: <47mndt$8qd@henry.netaxis.com>
Source record: 210507

Has anyone out there received satisfactory results with the Ramsey FX440 transceiver kit? I built one, but once completed, I noticed a plethora of ploblems. For instance, the microphone amp not working, the VCO being VERY susceptable to 'mechanical' noise (i.e. touching the board with an insulated tweaker), no power out, and lousy sensitivity. I thought I did a pretty decent job assembing this thing, but either I'm WAY off in my assembly techniques, or the kit's not what it's cracked up to be. I'm going to start troubleshooting the rig this week (I hope), and will keep any interested parties up to date.

From: briley@www.netc.net.au
Message-ID: <47nh8g$j2k@budapest.ozonline.com.au>
Source record: 210508

Hi all
I have been having problems with an FT757GX HF Tx/Rx.
The unit works fine, but suddenly the rx goes deaf on FM and the audio
is muted continually. On investigation, some diodes in the front end,
when replaced, fix the problem. The diodes check ok on a meter.
This has happened 3 times now, and the replacements have been Yaesu
parts - not substitutes.

I have heard this is a fairly common problem.
Any ideas??
Any fixes??
Are there better diodes than the originals to fix the problem?

Bruce
briley@www.netc.net.au

Most of the amateur equipment is made to sell features, not quality. By that I mean, the receiver isn't as important as the total bandwidth or beeps and whistles. If you buy a radio designed to receive in 30 MHz bandwidth, don't be surprised if it can't resolve down to 25 kHz.

My Master II radio never got intermod. But it wasn't designed to receive the whole spectrum, just a part of it.

Tucker Electronics 1-800-559-7388 sells a product called Tucker TF-144 for $59 + shipping. It's an inline filter, good for up to 50 Watts. On receive it switches in a filter for only the Ham band. I don't have one, just offering a solution you can investigate. Anything with a helical filter would be an improvement.

>there would be a naturally high number of them for sale?

The IC-706 started shipping. It blows the TS50 out of the water.
I suspect a lot of people are getting rid of the Kenwood so they
can buy the Icom. (The little Alinco blows the TS50 out of the
water too, but not by quite as much. That's the problem with being
first in a market niche, the follow up radios are usually better.)

> I have noticed an unusual number of TS50's for sale in the swap news group.

It isn't surprising, with the much-hyped IC-706 hitting the market! However, I don't plan to get rid of my TS-50, now that I have the new Icom.

It is hard to be objective, when you get to know one rig very well, and then try to learn a new one. The TS-50 certainly doesn't have all the new "bells and whistles", but I believe it is a better "basic" radio than the Icom. In addition, I believe the Kenwood AT-50 is superior to the Icom AT-180, on the HF bands. I find that the Icom tuner doesn't seem to be able to match as wide a range of impedances as the Kenwood. For example, the Hustler 40 Meter resonator could be matched by the AT-50 over the entire band. The AT-180 can't match it down at the CW end of the band, even though the resonator is adjusted for mid-band. (Yes, I do have a key in the car!)

Many of the IC-706 features may be of little use while driving. If you can live with a mobile rig that only covers through 10 Meters, a used TS-50 could be quite a bargain!

3873. 706: success with new mod?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-07 00:00:00 UTC
From: ab910@lafn.org
Message-ID: <1995Nov7.173907.12161@lafn.org>
Source record: 210516

Has anyone tried the new mod yet? What are the results?
Before you ask, the mod is to cut or remove the yellow wire located just
right of the s/m diodes from the last mod.

I'm hoping to improve the sensitivity above and below the 2M ham band.
HF is okay as is. Now without the mod the radio is useless from 148-200
and from 6M-144. Not as advertised to be sure.

M. Davies

Not to mention that the regulations of amateur radio in some countries REQUIRE the schematics of all transmitters to be presentable at the station at all times.

No, I haven't heard of spot checks of transmitter schematics, but I still wonder if WE get the schematics - or maybe every amateur who wants to use Icom has to draw one of his own.

Chris Hanson (cph@zurich.ai.mit.edu) wrote:

: I've used both of these, and IMO the Kent wins hands down. The Kent
: has a wonderfully smooth feel and a nice heavy base. I've owned one
: for a year now and I love it. OTOH, I think the Bencher is too light,
: and I have never been able to adjust it so that it feels good.

I was a Bencher user for 15 years until I switched to a Jones key.
The Jones key is much sturdier than the Bencher, which always seemed
flimsy to me. The Jones key is easier to adjust and holds adjustment
better than the Bencher.

Another thing about the Bencher that annoyed me was the silver-plated
contacts that became intermitent every few months. Running a piece of
paper through the contacts fixed the problem, but I've never had to do
this with the Jones key.

The Jones key is somewhat pricey, however. HRO sells them for $145,
but I've heard they can be gotten directly from the manufacturer in
England for less.

3891. Need Mods For Icom IC-736

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-07 00:00:00 UTC
From: yingst@knighted.com
Message-ID: <47m80v$5fs@crier.knighted.com>
Source record: 210601

Does anyone have any mods for the ICOM IC-736?

I'm looking for a way to turn the pre-amp back on below 1.6 Mhz.
Icom turns it off even though it the light says it's on.
I would like to listen for some lowfer stations 1750 meter band
(160-190 kc. 1 watt into a 50 ft antenna).

I'm also looking for a way to improve the recieve audio.
The recieve audio sounds flat and distant, lacking highs & lows.

With the notch filter ON the audio sounds a little better,
but it still could use some improvement.

They re-shape the audio through the notch filter,
and it actually has a nicer sound with the notch filter on
(Has more highs & lows).

I had a IC-737 that had the same problem with the audio,
just not sounding quite right.

I am also interested in any other mods for the Icom IC-736.

Please send any replies to yingst@knighted.com

Note: If you post a reply into this newsgroup I proably wont get it,
my internet provider only holds news for 1 day.

Thank You. Harry N6VUJ

>I'm looking for a way to turn the pre-amp back on below 1.6 Mhz.

Hi Harry, in general, a pre-amp will not help below 1.6 MHz because it amplifies atmospheric noise just as much as the signal. At that frequency, you can sometimes improve your SNR by bypassing all your RF pre-amps and going directly to the first mixer. If your noise level is higher than your signal level, all the pre-amps in the world won't help matters.

I'm looking for an HF rig in good condition. All band AC powered rig or rig plus AC power supply prefered. Yaesu FT-101?? or FT-102?? or similar ideal. Will trade any/all of the following, depending on the rig offered. All equipment is in good working order as described below. Other ham/shortwave related trades or cash offers considered. Dealer inquiries welcome.

Tandon LT-286 Laptop.
- 1 MB RAM (expandable) installed
- 60 MB HD Doublespaced to 120 MB
- Intel 286 CPU, socket for math co-processor
- 3.5" 1.44 FD
- Serial, parallel, external keyboard & monitor ports
- Large, clear, LCD display
- Includes case, ni-cad battery pack & charger/AC Supply, all manuals
- New lithium backup battery included (ordered 11/4/95)
- DOS 6.22 installed
- Automatic shutdown, password protection, many extra features
- Perfect for field working, contesting, general computing, etc.
- Because the nicad pack is old--will pay up to half the cost of a new nicad ($90 at Radio Shack--less via mail order), depending on trade
- Will include licensed software--Word Perfect 5.1 for dos, MS Word 4.0 (old but good for upgrade discount), Turbo c++, PC Tools, other dos based programs--depending on trade offer. All software includes full documentation and original disks (some in 5.25" format).
- Excellent condition with all original manuals, etc.

Zoom external 2400b modem.
- Great for use with Laptop above.
- Excellent condition.
- Manual and software included.

Colorado Memory Systems "Jumbo" 250 MB Tape backup.
- QIC-80 Compatible
- Works from your current floppy controller
- Includes 10 DC-2120 QIC-80 Data tapes ($250.00 value)
- Windows 95 compatible (CBW95 software included)
- Perfect condition with all software & manuals

SummaGraphics SummaSketch II 12x12 Digitizer tablet.
- Accurate & dependable digitizer
- Both puck & stylus included (stylus has pen insert)
- Reliable but warms up slowly (2-3 minutes) in cold environment
- All driver software (including Windows 95) included

Warp 10 VLB Graphics card.
- 1 MB RAM, expandable to 2MB
- High Speet VL Bus Accelerated graphics to 1024x768
- Up to 16.7 million colors
- Perfect condition with manual & drivers

DTC2290 EISA IDE Controller card.
- Up to 4 HD & 4 FD on one card
- High speed data transfer via EISA bus
- Perfect condition with manual & drivers

IDE Controller card w/serial, parallel, & game ports
- 2 HD, 2 FD, 2 serial, 1 parallel & 1 game connector
- Reliable and dependable
- Manual included

Greetings,
I've had my Tech license since 1990 but have never used it due to time and budget constraints. I've recently gotten interested again. After reading the ARRL Operating Manual, I've become interested in the VHF/UHF bands. I'm probably not the "rag-chewer" type, so I'm interested in SSB/CW operations. I would probably use FM for emergencies (on the road or while backpacking) or to talk with Hams with similar interests. Question: What is the best way to get involved in this kind of operations? I've read the brochures for new base station equipment, but the price is out of my league for the near future. I've read the ARRL radio buyer's sourcebook (vol. 1), but I don't have any idea what equipment is appropriate or what a fair price is? I need to get the most bang for my buck. Which equipment would get me started?

Example: A local (Seattle) shop has a Yaesu FT-290 (I thinks that is the correct model) 2 meter multi-mode for $375. It includes a battery pack, 12v power pack, mic, and antenna. I can't find any information about this radio. How old is it? Is it a good choice for my interests? Is the price fair?

If anyone would like to offer advice, or start a dialogue, I would appreciate it.

John

I know this story, Paul. I am very close to one here, and I have a 450 foot horizonatl loop up. It kills my 440 receiver unless I have a tuner in line. That is another thought: use a resonant antenna to reduce AM BCB pickup. If you too have a 450 foot loop, cut it down and put up a few resonant dipoles on 80, 40 and 20 or something like that and I am sure the problem will be reduced.

My question: Does the 850 put the auto tuner in line for the receiver as well as the transmitter? I do not know. I just modified the 440 so that the auto tuner is engaged for the receiver, and it clears the problem up very nicely.

There are also AM BCB filters out there. I think I saw one described in QST very recently. The solution I have always used with success is to use a good bandpass antenna tuner tuned for the band I am on. My present tuner is the MFJ Differential-T tuner, and it does really well. I believe any link coupled tuner will help a whole lot also. My old Z match used to do very well.

I believe that there are commercial boxes that are designed to eliminate AM BCB interference. I have seen a price sheet in a friend's shack last week, so that solution exists also.

Good luck.

>>Anyone know anything about the new Radio Shack 2 meter mobile
>>rigs.

Radio Shack HTX-212 Mobile Transceiver..
True FM transmit for superior audio and excellent performance on packet
30 memory channels
Priority channel selection
One call channel
Store up to six 15-number touch-tone sequences for DTMF paging or auto-patch
Microphone, external speaker and antenna jacks
On-microphone DTMF keypad
Multifunction scanning
Dual VFOs for semi-duplex operation
Frequency step selectable
Built-in subaudible tone encoder and decoder
Output power 45 watts(high) 10 watts (low)
$349.99

On sale this month for 299.00.

Frequency range (Factory)
Transmit.....144.600-148.000 MHz
Receive.....136.000-174.000 MHz

Can be modified to transmit in the MARS/CAP band. (Directions included)

Subject: Radio Shack Frequency Counter

>>A while back, someone posted a mod for a frequency hold button for the
>>Radio Shack Frequency counter.

How to add a hold function to the Radio Shack RF Frequency Counter:

Ground TP17. In the schematic, TP17 is pin one of U3, connected to
+5V thru a 47k resistor. On the circuit board, TP17 is on the display
side, just right of the lower-right corner of the IC. Grounds are about
1/4 inch below and to the right, the three non-tinned points in the large
area of metal.

I grounded TP17 directly and the display stopped. After lifting the ground,
the counter resumed counting at the beginning of a sampling cycle.

Personally, I would ground TP17 thru a 1k resistor. I haven't performed
the mod to my RS counter, since the pads are VERY small and my fine-tip
iron is at work. I will try the 1k Hold mod on Monday and give a report
(unless somebody beats me to it).

3910. Need Mods For Icom IC-736

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-08 00:00:00 UTC
From: yingst@knighted.com
Message-ID: <47p04p$bga@crier.knighted.com>
Source record: 210534

Does anyone have any mods for the ICOM IC-736?
I'm looking for a way to turn the pre-amp back on below 1.6 Mhz.
Icom turns it off even though it the light says it's on.
I would like to listen for some lowfer stations 1750 meter band
(160-190 kc. 1 watt into a 50 ft antenna).

I'm also looking for a way to improve the recieve audio.
The recieve audio sounds flat and distant, lacking highs & lows.

With the notch filter ON the audio sounds a little better,
but it still could use some improvement.

They re-shape the audio through the notch filter,
and it actually has a nicer sound with the notch filter on
(Has more highs & lows).

I had a IC-737 that had the same problem with the audio,
just not sounding quite right.

I am also interested in any other mods for the Icom IC-736.

Please send any replies to yingst@knighted.com

Note: If you post a reply into this newsgroup I proably wont get it,
my internet provider only holds news for 1 day.

Thank You.

: for 2-3 or more months in the shop for them to fix?

Butch,

A couple of months ago when my homebrew KW sparced and arced, I also thought I had "fried" my FT-ONE. But it turned out that the input fuse had blown. Hopefully, you'll be just as fortunate.

I can't locate my service manual at the moment and am working from memory so please bear with me.

As I recall, the fuse is really a 14V low-current lamp bulb that is shaped like an ordinary glass cartrige fuse. It's in series with the receiver antenna input and is physically located near the antenna changeover circuitry. Because I didn't have the exact replacement part, I replaced mine with a low current fuse (probably 1/16 A.). Although it had several tens of ohms of resistance, the receiver sensitivity measured the same as before the "excitement". My fuse replacement will protect at a lower overcurrent level than the light bulb, for what that's worth.

Hello to all who read this message.

I am letting you all know about a new WWW page which is Ham Radio,
scanner &
satellite T.V. related.

The page is at "http://www.burnabyradio.com/ham/brc.html"

We are: Burnaby Radio Communications Ltd.
4257 E. Hastings Street
Burnaby, B.C. Canada
V5C 2J5
Phone: (604)298-5444
Fax: (604)298-5455
BBS: (604)298-3283

WWW: http://www.burnabyradio.com/ham/brc.html

Please visit us!!!

Thanks.

Mathew,
Don't be worried about buying the 706. It is an excellent radio!
I got mine last week, and I love it.
I have two comments.
I thought I had a transmit audio problem, but I played around
with the settings, and found this not to be true.
The only thing I would change on this radio if I could, would be
the fan. It runs all the time, and speeds up when you transmit. I
would rather see it temperature controlled, like my Icom 751A. I
think however, that it may have to be like it is in order to
maintain the small size of the radio, without large heat-sinks.
It is about the same noise level as a computer fan. Really not a
major problem though.
This radio has many great software features, and with 6M and 2M
all mode, it is like getting three radios in one.
Recieve audio is quite clear, I don,t detect any distortion (by
ear), like some of the other HF radios that have recently come
out.
Reciever sensitivity seems to be very good. On two meter FM, it
is better than my FM mobile rig (with the preamp on). HF also
very good.

There's an adapter cable you can buy that will allow you to use the Icom TT mikes with the rig. And 10 watts out is just right to drive my 10 in 160 out KLM amplifier. I like the radio a lot, but I have noticed a couple of quirks. I don't like the dumb duplex system that doesn't understand we need + offset as well as - offset to accomodate repeaters in the 147 MHz segment. Ideally, the softkey would cycle through + - and reverse, but instead you have to go to the initial set menu to change the offset from - to + (or just enter all the + split repeaters as split frequencies rather than duplex frequencies using the quick split function). Icom should update the firmware to allow cycling the duplex split, however. And the noise blanker seems ineffective on powerline noise, though it works on ignition noise. A variable sensitivity adjustment would be helpful, could be done with a softkey.

On HF, though, it's a dream. I love the 1 Hz tuning, and the ability to slow the tuning rate to 1/4 normal for digital. Tuning steps are selectable at 1 Hz, 10 Hz, 1 kHz, and 1 MHz. I wish they hadn't skipped 100 Hz, that would be useful for rapid band scans. 1 kHz is too coarse for anything other than rapidly tuning to a selected band segment and then shifting back to 10 Hz or 1 Hz. (Another firmware change.)

The IF shift is nice, love the graphic display, but I still miss having PBT too so I can infinitely vary the bandpass. The optional FL-100 500 Hz filter is *essential*. The CW-R feature is novel, and useful (there's even a built in keyer if you go for that manual stuff (it'll even operate off the mike up/down buttons if you don't have paddles), I let the computer

deal with sending and receiving Morse so this is all moot to me). I've also found the memories useful, contrary to my expectations. I've got several popular HF digital frequencies programmed, and I can scan them for activity. TR is fast enough for AMTOR, or any other digital mode, and the radio continues the fine Icom tradition of good thermal design, though I was dubious about that at first due to the small heatsink. The little fan makes it work, but that fan runs *all* the time, and that can be annoying when just monitoring at a quiet location. A thermostatic switch ought to be added.

And I appreciate the WFM mode, even if it isn't stereo. I can monitor the aural VHF TV carriers as well as commercial FM broadcast. The FM broadcast reception is only a novelty in a vehicle with an AM/FM radio, but being able to monitor TV audio is useful.

Intermod problems have been minimal, though use of the preamp/attenuator switch is required at times to handle the dynamic range. My IC735 is better in this regard, and the crunch proof FT-900 is better still. Without seeing a schematic (none included, major bummer) I don't know if dynamic range can be easily improved or not. I like the big easy to read display, but find the [TS key a bit too close to the tuning knob. I'm always bumping the tuning when accessing the TS key. I don't use the lock key, but if I did I expect I'd be complaining about its location too. There's a two position dial friction adjustment, and that serves well enough to prevent accidentally knocking the tuning off frequency.

One of the best features of the rig is the ability to hook the microphone to the main unit while remote mounting the head. This gets the mike cord out of the way instead of tugging at the control head and tangling with the steering and shift levers. (You can mount the head at a convienent spot on the dash while stashing the main unit under the seat and bringing the mike cord up from there.) OTOH, if you trunk mount the main unit, you don't have to run a separate mike cable, instead you *can* plug it into the head. That flexibility is a nice touch.

The little internal speaker is *little*. It's Ok in a quiet vehicle, but an external speaker is better (and necessary if you remote mount the main unit). Icom offers a good external speaker, or you can do like I do and use a Motorola speaker. Of course there's a C-IV interface, and an accessory connector that brings out most everything you could imagine needing. There's a separate FSK jack too. This radio is a portable/mobile digital operator's dream come true.

If it covered 70cm, it would be good for satellite operations also. However, the addition of a MMT432S or SSB Electronics transverter takes care of that little omission (It'll do mode A without the transverter, but you need the 70cm transverter for mode B or J). With the very flexible split ability it has, the 706 can drive the transverter from 10 meters while also operating 2 meters. (Don't forget to put 10m into QRP power level to avoid frying the transverter. Very nice feature is that power level can be programmed band by band.) The only flaw is that you can't listen to the downlink at the same time

you're transmitting. That's a fairly serious problem. Ideally, the radio would have dual band duplex capability so you could monitor 2m while transmitting to the transverter on 10m (or better, have 70 cm capability built into the 706). Now *that* would make the radio *perfect*. :-)

For those who like to scan VHF Hi-band, we've discovered a mod that restores sensitivity, but at the cost of reduced sensitivity below 120 MHz. Icom should really make a firmware mod so that isn't necessary. The preselector filter should switch automatically when you tune the different ranges.

To sum up, this is a very nice radio, and at a very nice price considering what things cost today. I'd make a few firmware changes, and move a couple of buttons half a centimeter if I could (and I hope Icom considers doing at least some of the firmware changes I've suggested), but I'm pretty happy with the radio as it is.

I have two questions about making a J pole.

1) The plans show that the entire J is made of copper with
no insulating material between the two legs. The antenna
connects between the two legs. Wouldn't this short out
the transmitter?

2) How does a J pole rate with other antennas? 1/4 wave ground plane?

Hi all. I was hoping that somebody would be able to tell me the approximate value of a Kenwood TS820.
A friend of mine is looking for one, and the prices seem high to him. He would like the remote VFO as the only necessary option.

That leaves it as a Kenwood TS820 with the Remote VFO. If you could give me an approx value, it would be greatly appreciated.

Tnx. 73 de Jeff - VA3JFF

I use an active antenna for listening to Shortwave Stations. The model is a Datong AD-370. It works well with not too much "HUM" or other generated noise. I have never used it in the ham bands for the obvious reason - transmitting into an active antenna will fry the antenna!

John

P.S. Glad to see someone from Clemson reading this group. I have a couple of degrees from there.

3943. ARK-40 QRP Transceiver Mod

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-09 00:00:00 UTC
From: James Garland <garland@ohstpy.mps.ohio-state.edu>
Message-ID: <47t31k$bjg@pacific.mps.ohio-state.edu>
Source record: 210436

I've recently completed a modification to my ARK-40 QRP transceiver, by S&S Engineering, which I'm happy to make available to anyone. The ARK-40 is a frequency synthesized CW 40meter transceiver, with an outstanding receiver, QSK, built-in keyer, etc. It is built like a tank. Its one major flaw is the tuning mechanism --a series of thumbwheel switches--which make it difficult to tune.

My modification replaces the thumbwheel switches with an optical shaft encoder and an LCD display. A Basic Stamp BS2 microcontroller controls the logic. There are two tuning modes: a 1 kHz per step (32kHz/revolution) mode, in which the frequency is displayed on a moving "bandspread dial" which scrolls across the LCD as the encoder is turned. The second mode is a 100Hz/step (3.2kHz/revolution) mode, in which the frequency is displayed digitally on the LCD. One toggles between the two modes by pushing the momentary switch on the encoder. The modification has only three components: the Stamp BS2, the encoder (a Grayhill 32 position encoder -- Digikey part no. GH6102-ND), and a Scott Edwards LCD Backpack.

The mod seems to work flawlessly, with no discernible interference from the microcontroller (whose clock speed is 20MHz). The cost of the three parts is about $120, which ain't cheap, but not out-of-line considering that the ARK-40 is a high-end transceiver.

I'm happy to send the software listing for the modification to anyone who wants to upgrade their ARK-40. If you buy a Stamp BS2, the software can be downloaded through serial port on a PC. (Parallaxinc.COM is the URL for the company that makes the Stamp, and their editor/programmer package can be downloaded for free.) Jim W8ZR

Subject: (fwd) Icom IC-706 MARS/CAP Mod (here it is!)

From: kg7fu@aol.com (KG7FU) Newsgroups: rec.radio.amateur.equipment

Subject: Icom IC-706 MARS/CAP Mod (here it is!) Date: 30 Oct 1995 10:44:17

MARS/CAP Modification for ICOM IC-706:
Tools required:
1) #0 Philips head screwdriver
2) 10 - 15 watt pencil tip soldering iron
3) Magnifying glass
4) Tweezers

Remove the TOP cover by removing three philips head screws on the top and one on each side. Move the speaker bracket out of the way. Locate D-59, this is a three terminal SMD diode in an SOT package, about 1 x 3 mm (with the radio front panel oriented towards you, D-59 is located in a row of SMD diodes just to the right of the ribbon cbale header above the 9 MHz SSB filter FL-30. There are pads for 5 diodes with only three installed. D-59 is the second from the left). Useing tweezers and a low-wattage soldering iron (and magnifying glass, if necessary) remove D-59 by appplying some heat to the single leg side of the device while lifting gently, then apply heat to the other two legs and removing the device. Be careful not to apply too much heat, not to rip or burn any traces or not to leave excess solder on the PCB. Replace the speaker bracket and top cover. Apply power and reset the microprocessor.

TX = 1600 kHz - 54.00 MHz and 118.000 - 174.000 MHz

From: turner@safety.ics.uci.edu
Message-ID: <47taqb$lrh@safety.ics.uci.edu>
Source record: 210438

On the West Coast swap nets the TS 820 will go for between $350-$400 US I believe, depending on options. A VFO 820 seems to go for under $100 in any case, and sometimes gets thrown in with the deal. These are normal cases I see. Bargains come in under that.

Have your friend make darned sure that the Display works properly - that is a known weak point (that can be fixed). Also make darned sure that the final tubes are in good shape, like over 100 watts output on the higher bands. The tubes cost money these days :-) .

Good luck.

>>How old is it? It came out around 1986

>73, Moritz DL5UH

Moritz hit it on the head on the 1,2,3 approach.

On the FT-290, I don't know about lousy, but you get what you pay for.
Considering its age and size, its not too bad of a radio. I recommend a
pre-amp, a small power amp or combo. I agree with Moritz, that I wouldn't
plug it into a 100+ watt unit. That price isn't terrible, but isn't great
either. The new version of the radio (FT-290RII) runs about $650 - $675
street price, and INCLUDES a detachable 25 watt linear amp for the price.

I've got a FT-290R (VHF) and the newer FT-790RII (UHF), and have had pretty good luck with both. I use the pair for OSCAR work on AO-10, AO-13, and FO-20. My setup is pretty average (or below) for an Oscar station, and I can hear and work anything and everything my friend across town can with his $1800 FT-760 and better antennas.

For reference, I'm using:
UHF:
Cushcraft 38 ele 432 MHz cross yagi
no pre amp
no power amp (790RII has 25 watt output)

VHF:
Homebrew 14 ele 144 MHz cross yagi
el-cheapo 15db gain bipolar noisy pre-amp
Mirage 30 watt power amp

Good luck!

John Wagner wagnerj@watt.oedison.com

There's a hardware mod for extended TX (I *think* it's removing diode W21 - but would have to check). Extended RX is to hold down "B" and "#" for about 2 secs. on power on.

Standard disclaimers apply.

Mike

3953. ALERT! IF-10Bs now available!

Kenwood's Amateur Products Division has just issued a letter saying that the IF-10B has again maufactured "one time only [a] limited supply".

Boy, they're not kidding! There are only two parts distributors listed in the Kenwood letter. When I called the east coast disributor, I was told that they only received TWENTY (yes, 20, not 20,000 or even 2,000) IF-10Bs. So if you're interested in picking one up, you'd better call SOON.

Here are the distributors:

Pacific Coast Parts (800) 262-1312 or (310) 515-0207 (fax is 538-4919)
15204 Staff Court
Gardena, CA 90248

hours: 8:00 AM - 4:30 PM, PST

-and-

East Coast Transistor Parts, Inc. (800) 776-2626 or (516) 483-5742 (fax -5904)
2 Marlborough Road
West Hempstead, NY 11552

hours: 9:00 AM - 5-30 PM, EST

I know that the East Coast distributor (at least) accepts credit cards.

73,

Rick WB9GYT
Milwaukee, WI

Does anyone have any mods for the ICOM IC-736? I'm looking for a way to
turn the pre-amp back on below 1.6 Mhz.
Icom turns it off even though it the light says it's on.
I would like to listen for some lowfer stations 1750 meter band
(160-190 kc. 1 watt into a 50 ft antenna). I'm also looking for a way to
improve the recieve audio.
The recieve audio sounds flat and distant, lacking highs & lows.
With the notch filter ON the audio sounds a little better,
but it still could use some improvement.
They re-shape the audio through the notch filter,
and it actually has a nicer sound with the notch filter on
(Has more highs & lows).
I had a IC-737 that had the same problem with the audio,
just not sounding quite right. I am also interested in any other mods
for the Icom IC-736. Please send any replies to yingst@knighted.com Note:
If you post a reply into this newsgroup I proably wont get it,
my internet provider only holds news for 1 day. Thank You. Harry

Well, unfortunately, the U.S.P.S. disagrees with you about the legality
and the statistics professors out there at the University of Hawaii will
be glad to tell you that chain letters require more people than the
population of the earth to succeed more than a few levels.

Here is what the U.S.P.S. has to say:

ftp://garbo.uwasa.fi/pc/docs-net/chain.txt:

" FROM THE UNITED STATES POSTMASTER GENERAL:

Chain Letters

A chain letter is a "get rich quick" scheme that promises that your mail
box will soon be stuffed full of cash if you decide to participate.
You're

told you can make thousands of dollars every month if you follow the detailed instructions in the letter.

A typical chain letter includes names and addresses of several individuals whom you may or may not know. You are instructed to send a certain amount of money--usually $5--to the person at the top of the list, and then eliminate that name and add yours to the bottom. You are then instructed to mail copies of the letter to a few more individuals who will hopefully repeat the entire process. The letter promises that if they follow the same procedure, your name will gradually move to the top of the list and you'll receive money -- lots of it.

There's at least one problem with chain letters. They're illegal if they request money or other items of value and promise a substantial return to the participants. Chain letters are a form of gambling, and sending them through the mail (or delivering them in person or by computer, but mailing money to participate) violates Title 18, United States Code, Section 1302, the Postal Lottery Statute. (Chain letters that ask for items of minor value, like picture postcards or recipes, are may be mailed, since such items are not things of value within the meaning of the law.)

Recently, high-tech chain letters have begun surfacing. They may be disseminated over the Internet, or may require the copying and mailing of computer disks rather than paper. Regardless of what technology is used to advance the scheme, if the mail is used at any step along the way, it is still illegal.

The main thing to remember is that a chain letter is simply a bad investment. You certainly won't get rich. You will receive little or no money. The few dollars you may get will probably not be as much as you spend making and mailing copies of the chain letter.

Chain letters don't work because the promise that all participants in a chain letter will be winners is mathematically impossible. Also, many people participate, but do not send money to the person at the top of the list. Some others create a chain letter that lists their name numerous times--in various forms with different addressee. So, in reality, all the money in a chain is going to one person.

Do not be fooled if the chain letter is used to sell inexpensive reports on credit, mail order sales, mailing lists, or other topics. The primary purpose is to take your money, not to sell information. "Selling" a prod-

uct does not ensure legality. Be doubly suspicious if there's a claim that
the U.S. Postal Service or U.S. Postal Inspection Service has declared the
letter legal. This is said only to mislead you. Neither the Postal Service
nor Postal Inspectors give prior approval to any chain letter.

Participating in a chain letter is a losing proposition. Turn over any chain letter you receive that asks for money or other items of value to your local postmaster or nearest Postal Inspector. Write on the mailing envelope of the letter or in a separate transmittal letter, "I received this in the mail and believe it may be illegal."

>
Unless bright spark in Motorola knows otherwise, the answer is no.

Nearly all land mobile rigs use the same PLL for transmit and receive, the VCO's being switched under PTT/CPU control. For a repeater you need both transmit and receive at the same time. One solution is two use two radios, one for TX and the other for RX with some glue logic for COR and ident (as many have done), like the Radius Repeater.

The problem is that most mobiles are designed with wideband receiver front ends so that they can do a wide switching bandwidth for multichannel operation. Heavy duty repeaters base stations, on the other hand, usually have a narrow front end with an effective preselector, and are usually only operational on one fixed channel. You could use an external filter with a repeater mad up from two mobiles but by the time you do all of that you might be better to buy a second hand heavy duty repeater.

Like most things, it all depends on what you have to hand, how much you are willing to spend and the site you have in mind.

>
>If there is such a thing please let me know where I can find it.

According to my mod book you need to open the top and bottom cover, locate the PLL board and cut diode D5. You then reset the microprocessor by holding [function] & [MW] and turn power on.

This should work on the IC-725A and IC-726A. Make sure you keep the power level legal. enjoy!!!!

I am NOT responsible if the thing smokes!

>1) The plans show that the entire J is made of copper with
>no insulating material between the two legs. The antenna
>connects between the two legs. Wouldn't this short out
>the transmitter?

At DC YES,
But at VHF/UHF Frequencies, anything below the connect point is
invisible to the radio.
Many dipoles use a shorted tuning stub even on HF antennas!

>2) How does a J pole rate with other antennas? 1/4 wave ground plane?

A standard J-Pole is a single 1/2 wavelength element, or twice that of
a 1/4 wavelength antenna. A STACKED J-Pole are two 1/2 wavelength
antennas in phase, or four times that of a 1/4 wavelength antenna. A
MIRROR Image J-Pole is effectually three 1/2 wavelengths long or six
times a 1/4 wavelength antenna.

>pedition. DX hunters and those runninng contests should consider other
>radios (did I say a second-hand IC-735).

You're right, the 706 is no 735. I've been operating the two side
by side for a few days now. The 735 has better dynamic range, better
filters, and has PBT to let you tailor the filter bandwidth to suit
the signal you are copying. But you can upgrade the 706 filters,
the dynamic range problem is somewhat manageable with artful use of
the preamp and attenuator, and the radio is more convienent to
operate than the 735, and certainly easier to use mobile. All the
mods for this radio so far have been to improve out-of-band performance,
but when the schematics are finally available, I hope some mods will
be forthcoming to enhance its dynamic range. That's the *real*
drawback to this otherwise excellent little radio. (For mobile use,
which seems the primary niche for this radio, the lack of dynamic
range isn't as much of a problem because the antennas are inherently
narrow banded and have limited sensitivity. So dealing with huge
signals out of band isn't as much of a problem.)

With the optional 500 Hz filter, this little radio is a digital
operator's dream. Everything you need is brought out the back,
and the slow tuning is a godsend compared to the coarse and
quick tuning of the 735. Even tuning a Clover signal is a
piece of cake. You don't have to hold your breath while
nudging the knob like you do with the 735. And of course
having 6m and 2m allows you to do meteor scatter packet on
6m and regular terrestrial packet on 2m. I haven't tried
9600 baud yet (we don't use 9600 on 2m around here) but
I'm going to do some experiments this weekend to see what
the BER looks like. With a 70cm transverter, the radio
even does an acceptable job with amateur satellites, though
lack of full duplex capability is a limitation.

charles copeland <charles1@netcom.com> wrote:

Hello,

This is a very detailed description, which will surely inspire
many newcommers to build their own antenna. But particularily
for this reason, the shortcommings should be pointed out:

Although copper tubing is quite cheap, when you add up the
price for all the bits...

Not to speak of the additional material needed to weatherproof the
upen coax feed.
(a gp from simple stiff copper wire on a coax socket and plug is
better in this respect)

>6. Clean and paint the antenna if desired. White paint minimizes expansion
>and contraction.

Well, the author seems to believe that thermal expansion matters
for such an antenna. It is not.

>7. Route the coax and tape it to the mast to make it look neat.

He does not realize that the feed line can interact wit the stub,
and therefore it should be brought out at a right angle.

>NOTE: While theoretically a J-Pole is an omnidirectional antenna, You may
>find (many of us have) that it does have a small amount of directivity.
>Rotating it while checking field strength may prove interesting.

Theoretically the J-Pole is an antenna which requires a *symmetric*
feed. Using it without a balun does create problems, although not always
noticed.

Source record: 210464

>Anybody know how to get this rig onto Gen. HF tx/Rx so my group
>can work REACT with it on 27MHz.
>
That's not legal, even for REACT. Why not use a type accepted legal CB radio? Illegal CB activity has caused amplifier restrictions to be placed on Hams. All we need is for easy mods that allow violation of the equipment approvial to be stupidly posted in public forums, and a bunch of CB'ers to get in trouble with the rigs. Then legitimate users (ie. MARS or test bench applications) will be screwed up. Next thing you know, we may not be able to buy radios for use on ten meters!

After all, FCC rules do require that radios (and amplifiers) are not readily converted to violate equipment restrictions. Nearly anyone should be able to get a license. Only lazyness or gross stupidity would prevent it. I hope everyone has enough common sense to refuse to help you with your misplaced question.
Tom

C'mon fellers. Consider what you are doing when you ask for a reply by email.

1. You are preventing the rest of us who have an interest in this thread from seeing the whole answer -- this strikes me as being somewhat selfish.

2. You are admitting that you don't lurk this group very often and want a personal answer so that you don't have to take up your valuable time reading the newsgroup to pick up your answer.

If the question is by newsgroup, the return post should be by newsgroup.

3975. ** HELP with mic preamp

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-10 00:00:00 UTC
From: tgoins@accessone.com
Message-ID: <tgoins.18.003D2A54@accessone.com>
Source record: 210468

Hi all,

I have a Heil Dual desk mic that I am trying to get to work with an Icom 735. The problem is that the Heil does not provide enough output to the radio and I have to almost yell into it with the gain turned all the way up to get any ALC action at all.

So I went forth and built the high Z preamp from the schematic in the ARRL handbook. It is a real simple circuit that uses a MPF102 FET as an amp. One problem --- it doesn't seem to work. No output from the preamp at all.

Here is what I know.
1) The Icom 735 only has 8 volts available from the mic jack. The plans call for 12v.

2) The 8 volts is getting into the the circuit but the first thing it encounters is a 10K resistor which immediately drops the voltage a great deal. (is this resistor too big?)

3) I do not have an O-scope to check for audio in the circuit.

4) I built it inside of a metal box and I put panel mount mic jacks on both ends. The components are built on single sided PC board. At this point nothing is connecting the circuit board ground bus to the metal box. (should it be??)

5) I should have bought the Icom SM-8 instead of this Heil. You spend $100+ dollars and it ought to work without this grief. :-)

6) I need some help.

Thanks,
Todd

I own a two meter rig that I bought back in the late 70's. My problem is that when I try to transmit, the digital display goes blank and nothing happens. Prior to this I noticed a progressive power decline when in the hight power (10watts) mode.

I am wondering if anybody knows where I can get it repaired and if it is even worth it. Somebody told me to send it to Yaesu, but when I called I was told that the charges are 50 bucks an hour just to diagnose the problem. I only payed about 250 bucks for it brand new and don't want to spend that much to get if fixed.

Has anybody else had this problem, and is there any clues as to where to start looking to diagnose? If it is a potientially large repair bill, I will just chuck it in the gagbage and get a new rig.

Thanks

Rich,
Notice that the poster requested *E_MAIL*, not reply to the group. Since
I'm sure he was not aware of any illegality regarding using non
type-accepted amateur gear on the CB band, I'm sure your message was
appreciated, but reply via e-mail next time. One might otherwise assume
you were trying to start a *VERY* boring thread.

3979. Hints Needed, Icom IC-701

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-10 00:00:00 UTC
From: dsnowden@ccd.harris.com
Message-ID: <480cea$5vdu@rs2.ccd.harris.com>
Source record: 210472

I fixed this radio once, and fortunately the problem I had didn't involve stripping the radio. But the problem I have now (dial-lock and solid rit) have me removing the front panel to replace suspected bad IC's. Does anyone have experience with this radio - enough experience to have acquired any sort of disassembly - assembly procedures? i.e., is there any sort of manual available that has more than the standard users manual? I'd like to keep this radio working, as it is a good looking radio and is as small as most of the newer ones. The big drawback is that it doesn't seem to have been designed with maintenance in mind. For example, I see no way to fix my problem by actually looking at signals. You can't get to the suspect IC's without removing the front panel. Then you have nothing connected. I'm guessing most people sent them back to the factory where they had special jigs built just for troubleshooting them. Advice? Besides junking it?

Thanks, Doug, N4IJ dsnowden@ccd.harris.com

<stuff deleted>

As most folks on this newsgroup know, I work part-time for Radio Shack. I have for the last three years. In that time no one has ever accused me of being biased toward the company's products. You may however take the following with that proverbial grain of salt.

I already have all the 2m radios I can use ("afford" actually) but took one of those radios home for a tryout. I used it in my shack for a weekend and returned it. Not because I didn't like it, I just couldn't justify another radio at the time.

My impression was that it's a good value at the regular price and a very good value when it's on sale. It does all the things that the others' do, so there's no "beginners radio" stigma. The HTS-212 goes beyond that by including features that are extra cost accessories on the other radios. It comes with DTMF decode builtin and a multi-function microphone. The tone quality is pretty good. The controls are well laid out and the programming is easy to learn. The display is sharp and bright and the controls are lit. The buttons on the microphone are on the FRONT of the mic where you can read them while talking into it and you're a lot less likely to accidently press one. The radio's construction seems to be a lot like my icom 229H. It's essentially a heatsink with a radio attached to the front. I doubt that you'll have any cooling problems.

On the down side, I'd like to have a better audio output system. I drive a noisy old van. The HTX-212 doesn't have any better sound than my icom 229H. It's got the tiny top mounted speaker that can be overdriven when the volume control is turned more than 200 degrees. The transmit audio sounds a little like a DX contesters audio. It seems to lack bass response. It sounds a little "bright". It's a matter of taste and is not a big deal in my book.

In the several months since it came on the market I have not heard of one case where someone was dissatisfied with one. Since folks here are pretty quick to complain I guess that means it's pretty good.

I think you ought to add Radio Shack to your list.

I've captured a few comments from the net. I'll send those to your Email address.

Please let us know of your decision.

I wasn't impressed by Lew's review of the 870. It was mostly along the lines
of "Gee whiz, it's got some neat bells and whistles, and it must be good."
I'll wait for a more objective, substantive review.

F O R E S A L E

1. Kenwood TM241A 2m mobile, 5/10/50 watts, memory expansion unit
installed
- less than one year old, with manual, original box, mobile mounting
bracket, etc.
LIKE NEW!
Reason for selling: I'm moving to 70 CM.
These go for about $500.00 Canadian; make me an offer. I'm looking for
somewhere around $100.00 (Canadian) less then the new price, as this
radio is in great shape and hardly used.

2. Sony SW55: Portable Shortwave Receiver *Mint condition!*
- 125 memories
- 150 khz to 30 mhz continuous; plus FM broadcast band
- am/lsb/usb narrow/wide filter, extremely sensative!
Reason for selling: As a blind person I find this radio unnecessarily
difficult to operate, and want to move to a 2010.
- comes with carrying case, all accessories, manuals, etc.
I'd like $355.00 Canadian for this *firm*; also barely used.
I would provide prices in US currency, but I don't have a calculator
handy. If you're interested in either of these, let me know and I'll work
out the US prices.

3999. Alliance HD-73 Rotor Parts/Service Needed

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-11 00:00:00 UTC
From: jcox@GroupZ.net
Message-ID: <4836ag$qkt@news1.sunbelt.net>
Source record: 210360

My HD-73 rotor has failed after 15 years of good service. The plate that holds the gears in place has cracked and separated. This happened once before when the rotor was just out of warranty, but Alliance fixed it anyway. Now, the rotor is out of production and Genie/Alliance has no more parts of this type.

Anybody got any leads, or maybe an HD-73 with a bad motor for parts?

Boy, have rotors gotten expensive over the years!!

4002. Re: Q: How is the new IC-706 on CW please???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-11 00:00:00 UTC
From: n4lq@iglou2.iglou.com
Message-ID: <DHv5yE.1w0@iglou.com>
Source record: 210363

: Anyone using the IC706 on HF CW? Curious how it : works, how's the
keying, waveform, keyer, qsk, agc, : filters, etc.
Joe

I've been using the 706 on cw only for about a week now. I have been
using my ts940 for 5 years. I've used QSK for 32 years now and usually
operate at speeds between 35 and 45 wpm.

On the transmitter side of things, the 740 has rather hard keying. Using
the semi bk in mode, it sounds acceptable. I have a regular schedule with
another 940 user every night. He reports the keying to be "Fair" compared
to the 940 in the semi bk in mode. The qsk mode is quite a different
story. Frankly, I dont recommend using it unless you use an external
keyer to increase your weight. It simply keys the vox relay and it can't
keep up. AT 40 wpm it really clips the dits.

I bought this for mobile use and am willing to put up with it though. I
have been setting the vox speed at .2 seconds. This is fast enough for
most qsos and sounds good on the other end. The first dit doesn't seem to
be clipped either. The internal keyer is nice but there is no weight
control, just a ratio adjustment which IC trys to put over as a weight
adjustment! Actually, all it does is change the lenght of the dashes.

The reciever is quite good and in some respects better than the 940. The
main thing I like is the IF shift. The 940 has a varible bandwith
adjustment but I have problems with QRN here. The 706's shift control
allows me to move the passband out to the edge thus clipping off the high
frequency static. This is much like the old Drake R4. I got the 500
kc filter. It's skirts aren't as sharp as the 940 since the 940 has two
sets of 500hz filters.

Overall, I like it and don't think you can do much better for the price.
Beside, it fits in the hole where my ash tray is on my van!

> Are the dual-bands all that useful, or would a 2m unit be fine?

Either Yaesu radio is fine, as are the older FT530 or FT470. I'd avoid the Kenwood radios for a number of reasons, though there are those who like them. And don't forget Standard and Alinco. Both make nice radios in this class. I just sold my long time favorite HT, a FT470, this past weekend because I've got the new (and incredibly tiny) C508A Standard. It does what I need in an amateur HT, dual band, CTCSS encode decode, and costs only $268 new (street price). Now that probably isn't the radio for you because it is low power and has no TT pad, but I don't use phone patches (I have a cellphone), and I don't need high power (have a mobile rig which can serve as a remote base relay), so the little Standard was just ideal for my HT needs.

Now a dual band radio is going to cost more than a 2m only unit, but usually a lot less than 2 radios. Around here, 70cm is active and full of friendly open repeater systems, so I strongly urge people to buy dual band radios. That's not the case everywhere. In some areas there is very little 70cm activity, and in some areas the repeaters are unfriendly closed systems. This is a question you need to ask local amateurs to see what 70cm is like in your area. If you're not sure, or if you may relocate soon, then I'd go with a dual bander. Having the extra flexibility doesn't hurt.

Now I'm going to close with another standard piece of advice. A HT is a specialist tool, designed for foot mobile operation. It is not a good substitute for a mobile rig in a car or a base rig in the house. If most of your operation is going to be from a car or house, I'd advise you to put off a HT purchase and buy a good mobile rig instead. That can be used in the house too with the addition of a 12 volt power supply. It'll work much better than a HT, and used ones won't cost more either. Only if you're going to operate primarily foot mobile would I recomend a HT as a first (or only) radio.

>Metalic paint is powder suspended in laquer, thus each partical is
>insulated from it's neighbor by the lacquer.

That's Ok, the particles are ferrite and don't need conduction to adjacent particles, they don't in a ferrite bead or or toroid either. They form a dandy EMI shield though. GC Electronics sells an EMI spray. It should be available from any electronics distributor who carries GC chemicals.

>Why not just use spray glue and aluminum foil. When you reinstall the
>cover make sure it makes a ground connection.

And good luck getting the aluminum foil, with its insulating oxide coating, to make good electrical contact. It is also basically useless for stopping the magnetic field component of the EMI. That's where the ferrite sprays perform best. Copper screen is an alternative. You can easily solder to it, so getting good contact is no problem.

>Or for 40 bucks you can pick up a new mini-tower cabinet w/power
>supply all steel.

Now you're talking. Steel is a good barrier. It's resistive enough to dissipate E fields, and ferromagnetic with hystersis, so it does a good job damping rapidly varying H fields too. All seams should be bonded with a screw at least every 10 cm, and of course any paint needs to be removed from mating surfaces.

4005. Mod gone bad on FT-51R?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-11 00:00:00 UTC
From: childers@garlic.com
Message-ID: <4843nv$j2i@garlic.com>
Source record: 210366

I just performed the MARS/CAP mod on my FT-51R. Everything is working properly, except for the cross-band repeat. I can enable that mode, but the unit only receives, and never re-transmits the transmission. I use the cross-band occasionally as I also have a Standard C508A that I use as a mobile mic, and I have the FT-51 kick up the power to 5W.

Please HELP!

Hi. I plan to be doing some travelling and would like to hear your experiences about operating from hotel/motel rooms. I know 2 meters shouldn't be much of a problem, but I'm interested in exploring HF.

Can it be done reasonably well? Will I have to use QRP equip? How about SSB? Where the heck does the antenna go-- and what bands should I be considering?

Thanks for all your advice.

>
>1) The plans show that the entire J is made of copper with
>no insulating material between the two legs. The antenna
>connects between the two legs. Wouldn't this short out
>the transmitter?

The J hook is just a shorted quarterwave stub. It's used to match
the feedline to the upper halfwave element being end fed by it.
It's supposed to be shorted. Look up matching stubs in any
handbook for an explanation of how they work.

>2) How does a J pole rate with other antennas? 1/4 wave ground plane?

The J pole is just an end fed halfwave vertical. It should have
0 dbd, 2.2 dbi, gain. A quarterwave *with an adequate groundplane*
should have the same "gain". Because of the unbalanced feed, the J pole
may have a somewhat asymmetric pattern, but its lack of need for
a groundplane, and its direct DC connection to ground for lightning
protection and easy mounting, often make it attractive.

If you want gain, you can stack halfwave sections using hairpin
phasing sections. A four bay J-pole built like this has 6 dbd,
8.2 dbi, and is still mechanically rigid if made out of good size
copper pipe. The plumber's delight construction makes the J pole
easy to build, DC grounded for safety, and easy to mount.

Hello Darryl. I don't use a windows based logging program but I am using a dos based program that I am using in windows along with host master. I have looked at several logging programs and I really enjoy using this one.

It looks after the various awards and has a setup so that you set it up for generic awards

You can download it from KD7P's BBS at 360-653-9652. I think it is around $40 US to register. Best Forty bucks I have ever spent.

>I need help on finding out what is the speed control mechnism in a drill
>motor is? SCR or what?

If it's a brush motor like that on a sewing machine you may well find that it's a carbon-pile rheostat. Pressure on the pedal is applied through a stiff compression spring to one end of a stack of carbon discs. When the stack is compressed, its resistance drops. Works good and lasts forever. Newer models may well use a triac circuit that's set up to drive an inductive load. The pedal changes the value of a variable resistor which is part of a timing circuit. This delays the turn-on point of the triac for each AC cycle, thus distorting the AC waveform and slowing the motor. For induction motors, speed controls are somewhat more complicated.

Apparently Caltech has come up with a new fundraising scheme--instead of a
credit card, you get an Internet connection. Only 8 zillion dollars a
year, and you also get to hear a speech from the development director.

A couple of pointers, though.

1) You are posting on the electronics newsgroup. Most people here aren't as
interested in sheet metal work as you are. Please post only on
appropriate newsgroups.

2) You would like said sheet metal brake from a "geographically nearby
location". This is pretty tough, because nobody knows where you are.
I'm guessing that you're in Brazil, but who the hell knows from
"Caltech Alumni Association"?

I said: "I have a VIC 20 I want to trade for a IC-781" (how long do we have read thesre messages where some ham wants to trade his junk for something woth something).

From: KH2KQ@KA6EYH.#NOCAL.CA.USA.NOAM
To : K1OIK@KQ1K.MA.USA.NA

Hello Burt,

You actually got one of those VIC-20's you wanna trade?

I do not have a Icom 781, but I does have a Kenwood 950SDX - howsa bout dat?

Only problem is dat it am attached under the counter of a 36 foot motorhome. So if youse trade for da 950 youse gotta take the motorhome too. Its got a generator and only 123 actual miles. But the problem der is dat it am havin a dead battery and it can't start and it is in the driveway of my vacation home at the beach in Malibu - so youse also gotta take the house in Malibu if youse want the 950SDX.

Howsomever, there is a beach bunny and her girlfriend that said they would just die if I sold the Malibu house on the beach, so they come with the house and the motorhome and the radio.

If dat am OK, then weese got a deal!

Oh yeah, does the VIC-20 got a DC power supply with it?

By the by, if you hear of anyone who has a Kenwood TS-50 attached to a Mercedes 450SLC - I would like to trade a Radio Shack 202 for it!!!!!!!

The following messages were sent to me by a ham that is afraid to be identified beacuse of the torment most of you will put him through for having a different opinion. But it is how most young peeple feel (that is why they quit the hobby or never get in it). But you can keep thinking whatever you want and let ham radio die. Some say I send flames but I am not the author of below. I get lots of support and many messages like the ones that follow.

From: xxxxx@.xxxxcom
To: k1oik@ccsnet.com
Subject: You hate good news.
Date: Fri, 15 Sep 95 03:42:54

they like threats. they thrive off of it. i don't agree with everything you have said, burt. however, you are right on about several issues... one of them being the burping, farting, pants sagging in the crotch from too many handhelds on a waist that can't support them... i may carry a handheld, cellphone, and a pager all at once, but at least i'm not so out of shape that i have my pants sagging like they have a load in them. i stay somewhat in touch with reality... i liked the rabbit story. it made a pretty damn good statement... that's why they don't respond. many of them know that to take away code would allow intelligent people, people with more intelligence <gasp> than they are, into their little good ol' boys club.

no, not all hams that learn code are like what you described, only about i estimate 85-90% are like that, drooling with 10 handhelds on their belts looking like they're on some sort of mind-altering substance (too much rf overloading of the brain tissue). my group of friends and i all dress like we're the nightclub crowd for the underground scene... leather jackets with studs, some of us have half shaved heads (i'm probably one of the few that look almost normal), nocturnal, hang out on numerous 440 and commercial band repeaters, play paintball, get (raise eyebrows) exercise (i ride my bike at least 10 miles every other day), play sports once in a while, i love snow skiing, and take plenty of time out of the radios to go to the movies, spend time with my girlfriend (who just happens to like listening to the scanners with me once in a while to all the fire and pd activity), go camping, party...

seeing "young" punks like myself enter into the hobby bothers the oldtimer whiners and complainers on the local 2-meter boxes and the old fart elitist jerks that hang out on simplex on 144.245 around the valley

here, badmouthing everyone and everything that stumble across them on their commute home. i think my area has the largest population of INACTIVE currently licensed hams of just about anywhere. many of these people are interested in the "technical" aspects of ham, get their licenses, check into one of the local 2-meter high level boxes, hear all the old farts on all day pissing and moaning about colostomy bags, get dissillusioned and put their gear away in the closet. it's pretty sad.

they're so afraid that their little club will be "polluted" with fresh knowledge and arrogance to their little rituals that they lash out at any attempt to break the mold.

if you want to quote it, go right ahead, on one condition, DO NOT USE MY CALL LETTERS OR NAME OR EMAIL ADDRESS. i agree with the philosophies behind a great deal of your thinking, but i'm not going to put myself in a position where i get jumped on every time i respond or post in the newsgroup. i still find a few redeeming qualities in ham radio, and it is still (though more commercial communications / monitoring) my favorite hobby. i just happen to get exercise, prefer sex with my girlfriend over the radios, and eat somewhat decent food.

again, have fun with the quotes. just don't give me credit for them. i really have enough mail come into my mailbox on a daily basis without having to deal with drivel from some bloated cholesterol-laiden fuck who wants to discuss with me the merits of using a "bug" over a straight-key or trying to tell me how useless satellite communications are.

keep up the good work, burt. you're one of the few reasons i sti still read the newsgroup.

In article <4825d3$k1h@alterdial.UU.NET> Burt Fisher <k1oik@ccsnet.com> writes:

>Hams cannot stand to be personal. Thus they do not want to know THE
>name, the log wants to know THE name. Thus it is impossible for a ham to
>say "I would like to know YOUR name." A ham says, "What is THE name for
>the log?"

>Burt, K1OIK.

Burt,

If you looked closely at what is being said, you will see that one ham asking another ham's name for the log is entirely different than asking the ham for his or her name.

In the first instance, I am clearly stating as to why I want your name..I do keep a log of my contacts. Also this information can be used for sending QSL cards. All of this is quickly said by asking for your name for the log. However, I guess I could say "I would like to know your name because I am a nice guy,, I am keeping a log, and I might send you a QSL card". Hmmmm, seems a bit to much.

Hams are very personable otherwise you would not have FM voice, AM voice, SSB voice, or even ATV.

Ham operator Jokes:

1. What is the thinnest book in the world?
What hams know about women.

2. How does a ham take a bubble bath?
He eats beans for dinner.

3. What's a ham's idea of foreplay?
A half hour of contesting.

4. How can you tell if a ham is sexually excited?
If he's still breathing.

5. How many hams does it take to change a roll of toilet paper?
We don't know...it has never happened.

6. What's a ham's idea of helping with the housework?
Lifting his leg so you can vacuum.

7. What does a ham consider a seven course meal?
A hot dog and a six pack of beer.

Hi,

I am thiking of getting the Tucker IMD Filter for 2M. Part number
is TF-144. It claims to attenuate out of band signals up to and beyond 50dB.
I was just wondering if anyone here has any experience with one of these
things and if those claims are any good in actual practice. Do share your
experiences with this. For me it is either this or the PAR Notch Filter.
Thanks in advance.

Hi Folks,
I just passed my Technician's test this morning and I'm looking
to buy a handheld radio.
In general, the Yeasu and Kenwood units look the most attractive
to me, in particular, I think I like the Yeasu FT 11, and the 51 (are
these number right?) I suppose I have $300 or so to spend (maybe a
little more), but I'd probably want to get a used one.
Are the dual-bands all that useful, or would a 2m unit be fine?

Forget the spray paint!
Metalic paint is powder suspended in laquer, thus each partical is
insulated from it's neighbor by the lacquer.

Why not just use spray glue and aluminum foil. When you reinstall the
cover make sure it makes a ground connection.

Or for 40 bucks you can pick up a new mini-tower cabinet w/power
supply all steel.

Gary

4028. Reaquest about Standard C478 MODS

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-12 00:00:00 UTC
From: bruno.besace@fnet.fr
Message-ID: <485dcu$sbr@aldebaran.sct.fr>
Source record: 210307

I have a Standard handheld transceiver model C478.

At this day, my transceiver translate in UHF band twice 400.000
Mhz to 491.330 Mhz. At the lower frequency, when i want to transmit
under that limit, my transmitter write "OFF". So, it is an operation
not authorized from my transceiver. But in the upper band (like 498,000
Mhz for example), he did not transmit on that frequency and the screen
twinkled.

So, i want to know why that differencies, and may be if it is
possible to modifiate the lower limit to transmit in the 380 Mhz band.

That model of transmitter can too transmit a low power signal
on VHF band. And i meet the same problem with the lower (100,000 Mhz)
and upper (190,000 Mhz limit transmit.

Is it someone that knows how to modifiate my transceiver for a really
largest transceiver?

Thanks, in advance,

73,

Bruno, F1IQD

>* question, who should then post a summary of the responses. *

Actually, neither of these is always correct. Jim is right that it's pretty damn rude to post "please e-mail me, I don't read this newsgroup"--One would think that they could put themselves out enough to at least follow the group for a few days and see what gets posted.

If the subject is something that (1) doesn't interest many people, or (2) is not likely to be the subject of much debate, then e-mailing the poster is probably the way to go. Something like "Does anyone have an address for the Frozbin Widget Co.?" would fall into this category.

If there's wide interest, but no likely discussion, a summary may be appropriate. However, many topics benefit from discussion, which is not served by posting a simple summary.

I've read a number of the netiquette materials, and I don't recall any of them saying that "e-mail the poster and have him/her post a summary" was the only acceptable method. Several authors, however, have suggested it as one alternative.

In this, as in most other aspects of life, anyone with the One True Answer is probably wrong.

Does anyone know of a good source for these $40 all steel cases?

The only RF tight PC cases that I have ever found have been really
industrial strength, and cost between $700 - $1000.

All of the others are either wide open in front , or have a lot of plastic.

I would love to find a good source for these at a reasonable price..

(gary@ke4zv.atl.ga.us) wrote:

: >Or for 40 bucks you can pick up a new mini-tower cabinet w/power :

4041. Re: Antenna 4 Standard C508????

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-12 00:00:00 UTC
From: gkantor@intac.com
Message-ID: <486dlk$gre@nile.intac.com>
Source record: 210320

There is finally an alternative to the origional antenna supplied with this radio. Comet is now shipping the "SMA 3," a tri-band flexible antenna covering 144 / 430 / 900 MHz. They even promote it as a "Gain" antenna with package specs of 1.2 / 1.7 / 3.4 dBi, 10 Watt max. power and frequency coverage of 118~160, 250~290, 360~390, 420~470 and 820~960 Mhz.

The antenna has an SMA connector and does "seat" on the rubber ring around the radio's sma connector. The base is 3/8" Dia. X 1.875" metal followed by a 1/2" long plastic piece which tapers down to 1/4". The next piece is a ~7/8" metal sleeve, followed by a 6 5/8" flexible whip. Overall length is 9 13/16" which is long enough to tickle my underarms when I wear it on my belt, but not terribly long for a "Duck."

Performance in the amateur bands is somewhat better than the origional. It allows me to reach repeaters that I could only hear before, but the really dramatic improvement is outside the amateur bands. In places where I could just barely copy WX-1 (162.550 MHz) with the origional antenna, the SMA 3 gives full quieting reception and about a 1/2 scale reading on the LCD bar-graph. Aircraft band reception is similarly enhanced. On UHF, the results track pretty much with the VHF, although I have not yet had the opportunity to do any quantitative testing, it is, overall a nice improvement in performance. However, It does make the whole package look like the tail wagging the dog! The antenna is big enough to challenge the balance of the radio when it is standing upright. It makes the radio look like even more of a toy than before, but if improved performance is your goal, this is the best way to go.

The only other alternative I've found is to use an SMA Male to BNC Female adaptor. This will allow you to use either a BNC "duckie" or an external antenna, but I would not want this to be a steady diet. The adaptor relies on the SMA connector as it's sole means of support. It does not come into contact with the base 'ring' surrounding the connector, placing all of the stress and moment of inertia on the connector itself. If you drop the radio and it lands on the antenna the wrong way, it is possible to damage not only the connector, rendering it impossible to put the regular antenna back, but also to damage the case of the radio, neccessitating rather extensive and expensive repairs.

All things considered, until someone markets an antenna for this radio in the 6" long range, I'll stick with the Comet.

Gary,
WA2BAU

4044. re: Where can I get copper tape/mettalic spray paint

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-12 00:00:00 UTC
From: Michael.Black@juxta.mba.org
Message-ID: <dd3_9511122230@mba.mba.org>
Source record: 210323

morganp@freenet.edmonton.ab.ca () is wondering where to
get copper tape, so he can keep his computer from interfering
with his radio.

I've wondered myself where to get copper tape. I know 3M makes
it (I got some literature from them once), and presumably a
distributor could get it. Of course, I've never followed that
up since I assume it might be hard to get the small amount I
need that way.

I came across a column in the local paper about where to get
supplies for making stain glass windows. Right there the columnist
specifically mentioned copper tape, and listed a couple of local
stores that sold stain glassed window making supplies where you
could get it.

So I'd suggest looking in your yellow pages for similar stores.
Maybe hobby or craft supply stores would carry it.

I haven't actually gone into one of the stores yet to check it
out, but this is a start. It was my impression that the tape
actually has adhesive on one side. Remember, if that's the
case, that side of the copper may not make an electrical connection
to whatever you are sticking it on. You might need to solder
the copper tape together at appropriate places to make the
shielding sound.

If it's more like a strip of thin copper foil, it should still
fit your application. Just use to some rubber cement to keep
things in place, and again, solder the edges together.

Hope this helps.

4050. Reasonable Yaesu FT-ONE Price?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-12 00:00:00 UTC
From: "Alan F. Olson" <aolson@halcyon.com>
Message-ID: <483h3u$94i@news.halcyon.com>
Source record: 210374

I paid $900 for a Yaesu FT-ONE. I think it was originally purchased in '82 and has gone through 2 owners. I seemed to work good at the shop, but I'm still pretty clueless since I'm only about a month into studying for my Tech+ ticket. Is this a reasonable price? The previous owner added more ram and an optional AM crystal filter. It came with a MH-1 B8 microphone, but no CW paddle. Thanks for the help.

Source record: 210377

pmarkou@ferrets.iii.net (Peter M) wrote:
>I'm looking for some information about
>the Icom CI-V interface to remotely control an Icom radio.
ICOM COMMANDS:
You can order the technical manual (which covers all ICOM radios and
their commands, as well as how the interface works, from ICOM. Mine is a
bit out of date, but it was called "CI-V Icom Communication Interface - V
Reference Manual."
INTERFACE:
There are several cheaper alternatives to the ICOM-made interface unit.
One is from MFJ (see their catalogue). Or, you can build your own for
about $15 (depending on your junk box: see QST JULY 1992 page 37.
(Powered by RS232 port and a circuit board available from FAR Circuits.)
This article also gives the ICOM address for the Reference Manual. I
built this 3 years ago and it works fine. All it does is convert from
RS232 level at the computer to TTL level at the ICOM.
COMMENT:
It is very easy to program the ICOM, using the manual.
The only complaint I have is that the default baud rate is 1200 baud, and
to change this you need to cut/add diodes on the RX logic board (inside
my IC-728). I have chosen not to do so, but find the 1200 baud is plenty
fast for all my uses.
Any questions, send me a note! 73

I am currently an inactive ham and want to get back into the hobby. I want to upgrade from my Kenwood 520TS to one of the following models. I would appreciate any user reviews to help me make a decision.

ICOM IC-706
YASEAU FT-900/AT
KENWOOD 50S
ALINCO DX-70T

Also, if you have suggestions other than these radios (as you can tell I am looking for something compact), please let me know.

Finally, I need advise on good dealers to purchase from.

Thanks in advance for your help.

: Ham operator Jokes:

Hi Burt! I really miss your *perspective* on amateur radio over there on
the RIME network.

: 1. What is the thinnest book in the world?
: What hams know about women.

I heard "Italian War Heroes" myself.

: 2. How does a ham take a bubble bath?
: He eats beans for dinner.

Yeah, I heard "How does a redneck take a......"

: 3. What's a ham's idea of foreplay?
: A half hour of contesting.

I heard "Brace yourself Martha"

: 4. How can you tell if a ham is sexually excited?
: If he's still breathing.

This one is very old......

: 5. How many hams does it take to change a roll of toilet paper?
: We don't know...it has never happened.

The version I head was "Men" and not just hams.

: 6. What's a ham's idea of helping with the housework?
: Lifting his leg so you can vacuum.

Once again, I had heard "men"

: 7. What does a ham consider a seven course meal?
: A hot dog and a six pack of beer.

Once again, I had heard "men".

Burt, you're gonna have to do a little better than this!

Cheers!

Andy

>
>73 from we here (not there) at K1OIK where THE name are Burt.
>--------------------------------46492684123405--

Burt:

Did it ever occour to you that meeting someone in person is differnt
than meeting them on the air? In my 15 brief years as a ham and SWL I
have never heard a conversation, amateur or commercial that resembled
one I would have with someone face to face.

I dont remember ever telling anyone I was talking to face to face that
their voice was just above the noise level.

Furthermore I dont expect my radio contact to use perfect grammar or
say and do the things I do in order to enjoy communicating with him.

By the way Burt, whats this got to do with building and experimenting
this is rec.radio.amateur.homebrew isnt it?

Regards,

Tim Hynde ka8ddz

> was hoping someone could give me some hints, mods, problems ect. Any help
> would be appreciated....

I had one for a long time. It's a dandy little rig that was intended as a mobile rig; Yaesu named it the "Wayfarer". It works fine as a base station. It's unusual in that it has both an analog dial and digital frequency display.

No real problems to report; mine worked just fine. It's a pretty basic rig, with no frills. There is an external VFO available that's kind of odd; it's a flat box that goes under the rig, and there's no dial; you adjust frequency with up/down slew switches. The VFO in the main radio is not a synthesizer; it's a real analog VFO. The external vfo is synthesized, and it has some memories. I had one for while but found I never used it, so I sold it. It's a fine little rig. Best of luck.

Apply Locktite fluid to the thread and then tighten. I did it 3 years
ago and it worked fine ever since. Locktite compound can be found in
True Value for about $3..

I have the IC25H, same radio but higher power. As far as I know there
are no mods for this radio. Owned mine since 1983. But, the only mod
I have done to it is to add a CommSpec Tone board...mother nature
modified my 25H shortly after I got so had to swap some components
with the pieces of charcoal in the rig.

It has been working fine since...except for the time in New Mexico
(dry air) when my XYL disconnected the antenna (we had just finished
listening to the Shuttle as it passed to the west) and connected it
again (while the radio was powered up) and took out three stages in
the receiver circuit. I may have gotten the last of the components
for the fix from Icom. Other than all that and the memory retention
circuit, all's fine. <grin>

The optical trade uses these rings and use a wrench that they call
a *spanner* to tighten them. You can buy universal spanners that
consist of a bar with two adjustable "points" that engage the notches
in the ring. Optical supply houses sell them, Edmund Scientific
probably carries them.

There are a couple of "field expedient" solutions you can try.
You can use snap ring pliers end-on as an expedient spanner,
or you can cut a piece of tool steel stock to form a fixed
spanner of the right span for the particular nut you're tightening.
This is really the best solution, just fire up the milling machine
and machine an anealed tool steel bar to the proper dimension,
heat treat it to restore temper (ordinary oil hardening tool
steel can work, though beware of warpage, but air quench steel
will hold a tighter tolerance), and there you go, a custom
spanner just for tightening the antenna nut.

Or you can pitch the oddball nut and replace it with a thin
hex nut and use an ordinary 11/16ths socket wrench on it.

For Sale by KK5GN:

1. Amplifier: MFJ AL80B 1000W $900 Amp was used about 5 times. I have the original boxes and documentation. I purchased it on June, 30 1994.

2. Audio Filter: Timewave DSP-59+ $200 Purchased 9/20/94, I have documentation and orginal box.

I will ship which ever way you want, you pay for shipping.

If interested E-mail me at Jlavis@beta.delphi.com

>Apply Locktite fluid to the thread and then tighten. I did it 3 years
>ago and it worked fine ever since. Locktite compound can be found in
>True Value for about $3..

If you use the 270 series Locktite (red) be advised...it will NEVER come
apart again, even if you want it to. I would recommend the 240 series (blue)
for this, it will hold the nut just fine, and still be able to remove it if
you have to.

4092. Looking for info on military radio

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-13 00:00:00 UTC
From: mckee@fc.hp.com
Message-ID: <487vp2$5r4@fcnews.fc.hp.com>
Source record: 210266

Greetings:

I stopped at our local surplus store this weekend, and was surprised to see a military radio there. Unfortunatly, it was impossible to learn very much about it just by looking, and of course there is no documentation with it.

It is a US radio, and the front panel identifies it is a T282/GR, and it had a sticker which said "Modified for SAGE". Can anyone tell me what this is, if documentation would still be available, and anything else?

73,

Bret "looking for a winter project" Mckee

Tom,
When AM came out and replace the spark transmitters they
all thought each other WAS SCUM
(Tom AM referenced above is a emission type FYI)
And then when the SSB started replacing AM they were all SCUM again
SO I guess the HAMS have been DOUBLE SCUMMMMED

BTW 11 meters SSB is a mode allowed on CB
So the CB SSB'er are being CB'er all the way
in deference to your remarks below

And scum of radio.. try tuning down to 75 and 80 meters..
you might find some real good butties down there

Lighten up.. I'll bet your a lot of fun on the local repeaters

4094. Re: Best Cw filter for TS850?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-13 00:00:00 UTC
From: turner@safety.ics.uci.edu
Message-ID: <48817k$pkd@safety.ics.uci.edu>
Source record: 210268

This is all a matter of personal taste and the operator's desire to get rid of QRM. I have the 250 Hz filters in everything except one Kenwood 440, which has the IRCI 400 Hz filter. IF you use the IF shift control along with the narrow filters, the tuning is not hard, and is quite a joy to put it right at the tone you like. I much prefer the 250 filters personally, but know a lot of guys who like the 500 Hz filters. Many guys have the 500 Hz filters, then get more serious about CW, and they find they need to upgrade.

Hey, with the 850 you can have both anyway? Get one of each? On the used market, it shouldn't set you back too badly!

Good luck.

power
>> level legal. enjoy!!!!

It ain't legal even if you keep the power to five watts. Personally I
think the AM guys on channel six have more brains than the guys that
modify Ham transceivers to operate all over below and on ten meters. If
someone wants to be a CB'er, be a CB'er all the way,,,,,Instead the SSB
CB'ers try to be a self-righteous psudo-Amateurs by assigning themselve
fake callsigns and following fake self-made rules. But when it comes down
to it, the SSB CB lids break more rules and cause more trouble than the AM
kilowatt operators ever do! They are the SCUM of radio.

: ground plug on the wall outlet, but I am still getting RF all over the
: radio on XMIT. Any advice as to what to so? I am using a tuner also
: (incase swr goews over 1.5 to 1) but it doesnt make any difference whether
: tuner ios in line or not. HELPPP!!!!!
: -Mike KS4DA

If you can not get a good earth ground, you might try a counterpoise.
Cut a piece of wire to 1/4 wavelength at the frequency that gives
you the most rf on your rig and attatch it to the ground lug. It
should help keep the rf from biting you.

4101. NEEDED: UT-49 DTMF pagin/code-squelch board for Icom handheld

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-13 00:00:00 UTC
From: 2WSK000@gc.maricopa.edu
Message-ID: <01HXLM52BITK0036UF@gc.maricopa.edu>
Source record: 210275

Through this net I have recently acquired an Icom 3SAT handheld (in the IC-2SAT/4SAT series of small HTs). The set is missing the UT-49 Touch-Tone code-squelch/paging board, which I will need to help ham communications with my soon-to-be-licensed wife. If you or someone you know has one of these internal-option boards available, please e-mail me with the scoop. It's OK with me if either the board was purchased but never used, or used but removed and saved when the set in which it was installed was sold. If the board works and the price is reasonable, I'm interested.

I will be looking forward to e-mail from any of you who can help.

Thanks.
Steve N7AJP/Phoenix 2WSK000@gc.maricopa.edu

P.S. I have for sale or trade an extra CTCSS (PL-transmit) board (UT-51) for that same series of Icom handheld transceivers.

Ok.. In breif.. Remove both top.. and bottom covers of the raido.
remove SPEAKER ..(easier to work with)..

Then remove the face.. 4 screws.

You will find a GREEN WIRE.. Its the only GREEN WIRE.. CUT IT!!!!!

THEN YOU MUST RESET THE VFO.. MUST for wide band mods... Then you have it!

Aw gone! AES and Radio City have advertised some remaining band units, but
the radio was disco-ed in 1994. Too bad too, since Icom's "replacement" only
offers the 2/.70/.23cm bands, no choices! (This ain't Burger King, you only
get it OUR way!)
Have to stick with Kenwood if you want/need 6m or 125cm along with the
standard bands in one mobile box.

: charles copeland <charles1@netcom.com> wrote:
: >
: >From: N6DCD@KB7WE.#WWA.WA.USA.NOAM (packet)

: I have two questions about making a J pole.

: 1) The plans show that the entire J is made of copper with
: no insulating material between the two legs. The antenna
: connects between the two legs. Wouldn't this short out
: the transmitter?

The short arm of the J and tthe bottom section of the long arm form
a 1/4 wavelength section of open wire transmission line. This
transmission line is arranged as a shorted stub, thus the impedance
along the line varies from 0 at the short to infinite 1/4 wavelength
away, with the feedline connecting at about the 50 ohm impedance point.
The open end of the shorted stub just happens (yeah right) to be a
very good match to the high impedance at the end of a dipole antenna,
and guess what, the length of the portion of the long arm of the J
that extends beyond the end of the short arm is 1/2 wavelength long.

The J-pole antenna is simply an end fed 1/2 wave dipole with a 1/4
wave matching section that happens to be physically constructed from
the same piece of material as the radiating element.

: 2) How does a J pole rate with other antennas? 1/4 wave ground plane?

A J-pole should have the same characteristics as a dipole.

I own a TH27, and it is a 2m hand held. (144-148 Mhz) VHF only, not
a dual bander. The dual band equiv would be the TH79 or similar.

Please contact me if you require specific info.

Hi my name is Chuck,

I'm posting this for a friend that has a TM-732 dual bander. He has had it about 2 1/2 years and it has been working great since he bought it. Last Friday night it was working fine, Saturday morning he turned it on, the "dial" lit up and looks normal, but it there isn't any audio on receive and no audio or RF output on transmit on either band, also there isn't any beeping when you push the control buttons.

Have you ever had a problem with this? Do you know what might be wrong? He is running it as a base station and using a 20 amp Astron power supply for the "12V dc" supply.

If you can be of any help, please E-Mail at: crhanson@athenet.net

Thanks and 73 Chuck N9OEQ

TOM.BIGGS@DSCMAIL.COM desperately seeking antiquity. ;)

>I'm seeking a vacuum tube. No, not an old 4-pin tube for an
>Atwater-Kent, just a regular ol' 6GH8A. Local suppliers are
>coming up empty.

Hi Tom; I have had Atwater-Kents that I destroyed as a kid. Early 40's.
I may still have a few 4 pin tubes left. The 6EA8 is identical to the
6GH8 and became the 6EA8/6GH8 tube types by the mid 60's as they were
separate tube designs to begin with. They were too close in operating
characteristics to remain separate tube types.

> If someone could point me to a mail-order source

Here is the list I have. Standard disclaimer. I have no connection with
any company listed, financially or otherwise. I have had no dealings
with them either.
I have a cross reference system that I have used for 30 plus years that
I posted here a couple of months ago on this conf. I you are interested
it is large, about 6 or 7 postings of 130 to 140 lines each.

Oh, I see, the self-righteous calling the self-righteous self-righteous.

I've only been an amateur radio operator for 18 years and I would have to agree with some of the observations. But amateur radio is not the people who participate, but the act of participating. Yes there are some bad apples, but in most activities which concentrate a group of individuals with a specific activity, such as talking to each other on the radio, this is bound to happen. Unfortunately, we are not all as perfect as we should or could be, but I didn't get into amateur radio to join some perfect elite group, I got in because I found being able to communicate over thousands of miles, with a make shift antenna and a relatively inexpensive radio, pretty cool. Other people probably got in for other reasons. Sadly, I think a vast majority of amateur radio operators don't even know what the FCC part 97 reason for amateur radio's existence is.

Don't let the bad apples spoil the excitement that can be found in amateur radio, there is something there for everyone (wives/girlfriends too).

Some of us would really appreicate it if you would take rec.roller-coaster
out of your follow ups. Is that too much to ask? It's questionable what
this has to do with anything, but it certainly has nothing to do with
roller coasters.

Thank you.

BURT,
Annoying, slandering, mean-spirited are all easy attributes
and you excel in every field. You occasionally kinda sorta
show some intelligence. Why don't you quit taking the LAZY
route of cross-posting, and instead narrow it to the respective
group.
If seeing the responses generated by your remarks fascinates
you, I'm sure somewhere in the halls of M.U. is a psychology
professor that may be able to help you.
Of course, practicing what you preach would be nice too !!!

In article <DHzopq.Ky2@eskimo.com> STOP @CROSS-POSTING.COM writes:

BURT,
Annoying, slandering, mean-spirited are all easy attributes
and you excel in every field. You occasionally kinda sorta
show some intelligence. Why don't you quit taking the LAZY
route of cross-posting, and instead narrow it to the respective
group.

Geez, don't give him a clue! I've got a killfile that zaps all postings to more than 5 newsgroups, since anything that widely crossposted is always a waste of time. I had idly wondered why all the Burt followups had dropped off my radar, but was mainly just happy that they had. (I happened to trip over your posting while experimenting with a different newsreader configuration.) Burt, *please* keep on crossposting, it really helps me out.

(BTW, I also kill every post with a subject in ALL CAPITAL LETTERS. They're also uniformly worthless. Funny how these things work.)

Rich

4135. ICOM 706 Computer Control?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-14 00:00:00 UTC
From: jreed@primenet.com
Message-ID: <48aatt$1hp@nnrp1.news.primenet.com>
Source record: 210105

Has anyone been able to get the computer interface for the new 706 to work? I have the interface box and a program that should work and I can see data both in and out of the radio but so far no cigar. I have tried changing the setting in the radio but nothing so far. I have tried to call ICOM Tech Support but after 15 minutes of listening to dead air (no music - no nothing) at day time rates, I gave that up as a lost cause. I might also comment that the lack of a schematic with the radio is completely devoid of all reason and I would like for Hams as a group to come up with some kind of a suitable response. In general I like the radio and would like to use the computer interface. Any help would be appreciated.

4141. TS 130 modification - filter and RF amp

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-14 00:00:00 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <996.816310394@safety.ics.uci.edu>
Source record: 210282

Anyone playing with the TS 130 lately? I picked up a compendium of mods for the 120 and 130 (mostly 120) and found two very useful looking mods: one to put in an extra crystal filter in SSB (for a total of two filters, 16 poles, in line all the time) and one to put in an extra RF preamp to perk up the receiver (good for the loss introduced by the extra filter).

Anyone done all this? I have installed the filter, works very nicely. About to put in the RF preamp, but puzzled as to whether to put it ahead of the internal RF preamp (as per the mod) or to put it between crystal filters at the 8.8 MHz IF stage. Anyone know much about the tradeoffs?

Hi,

I would like to know if the CI-V remote control protocol when
interfaced to the IC-706 has the following capabilities:

1. Reading the interference level (or a function thereof, like the AGC
level). Since the graphic display can show this information it ought
to be reachable via the CI-V.

2. Setting of operation mode (USB, LSB, etc)

3. Setting of transmitter power

4a. Max frequency change time when setting the full frequency from the
CI-V interface

4b. Max frequency change time when switching between memory channels

5. Reading SWR

6. Using the IF shift interference rejection function from the CI-V
interface

Mike,
Try running a ground wire to a water pipe. Unless you have
plastic plumbing, the water pipe would be a much better ground
for R.F. then the electrical system ground.

>to reduce the fade with the present radio?
>--
>Wayne Watson

Hi Wayne,
The problem exists with all car radios, but is aggrivated by a lack of AM sensitivity in the aftermarket ones. Most factory AM car radios are designed to present a very high impedance to the antenna, most aftermarket ones are not!

The antenna on your car is a voltage probe on the AM band. It senses the electric field. That makes the antenna couple to a very high impedance source, a lot of voltage compared to the available current. The low radio input Z loads the antenna down by requiring too much current, and that reduces the voltage.

The power lines do the same, they disturb the electric field by "loading it down". So the voltage available at the car antenna is reduced when you are near them!

Yes , but one must be careful as to which locktite ones uses. Some is forever(not removeable). Best bet would be the blue stuff. It has a picture of a nut with a blue center and states REMOVEABLE on the label. It's some times refered to as liquid lock washer.

>I have a copper Jpole up on a mast. I would like to ground it.
>How would I do this?

Assuming you're using a metal mast, and it's clamped to the mast, just ground the mast. #8 copper to an eight foot ground rod. Use approved grounding clamps on both ends. If you're using a non-conducting mast, then place the ground clamp at the bottom of the J in the J-pole and wire to the ground rod as above.

4154. Re: Icom 706 - modified advertising! Check web site!

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-14 00:00:00 UTC
From: kg7fu@aol.com
Message-ID: <48aoeu$8j6@newsbf02.news.aol.com>
Source record: 210295

This talk about FM Stereo reception peaked my interest since I'm in the broadcast industry. I doubt the selectivity nor bandwidth of the 706's IF filtering will allow enough of the composite signal to pass to properly decode the stereo matrix. If I'm wrong, you'll need to take a sample of the composite signal before the discriminator and route it into an external matrix decoder and detector. Motorola thoughtfully provides several multi-function IC's to do the job. My personal opinion is it's a waste of time.

From: Jim Devenport <jdevenport@lanl.gov>
Message-ID: <48audl$16c@newshost.lanl.gov>
Source record: 210300
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Normally the j pole is grounded at the base or lowermost
portion of the "J". My recent Jpoles are built as part of an
existing grounded structure, with the main pole or support
forming the main part of the J and the 19" 2 meter stub
clamped to the side at the appropriate distance from the top to
make the top part of the grounded structure radiate at 146 (or
whatever freq).

PEOPLE!!!

IGNORE THIS CRAP!!!

JUST LIKE ANYONE ELSE IN THE WORLD WITH A POOR ATTITUDE, IF YOU IGNORE THEM
THEY WILL GO AWAY!

(But I have to admit, the new burt signature is a roll!!) ahhaha

I dont many hams over 40 years old, so, I guys Im not a ham then.. Most
hams I know are all under 40, some under 20. And about 30% of them are women.
Its the 90's, and women enjoy hobbies of this sort also. More power to
the lady trying out for playboy, good luck to you. I used to date a model
that worked for "Hef".
You'll have fun im sure..

See ya all later...

Cecil, you might want to pass along a reminder to your co-worker:

The national headquarters Communications Group of the American National
Red Cross strictly enforces the ANRC policy of compliance with the FCC
rules; this includes Type Acceptance of all radio equipment used on ANRC
frequencies. "483q96$190g@chnews.ch.intel.com" is seriously jeopardizing
his ANRC status as either volunteer or professional staff. At the same
time he puts at risk both the ANRC local chapter radio license and his own
amateur license. The IC706 does NOT meet the FCC's technical requirements
and is not permitted by ANRC.

Hello All
I'm looking for a cheap 2 meter reciever for a project I'm
doing. Something I can use Ni-Cad batteries with, and to fit in a
small space. I've looked at some kits, but they are a little big.
Any suggestions are welcome, since I just bought an ICOM 2 meter
handheld for the job in the meantime, also I need 3 recievers for 3
seperate automata with handhelds this would get a little pricey.
Thanks for any advice you can offer...

I got a roll of metallic tape from an HVAC (Heating/Airconditioning)
service man. It appears to be aluminum. VERY strong glue.

I just bought one of these yesterday. Seems to work pretty well. In addition to the 9volt battery, it can also be powered by a 12 volt supply. It comes with a jack for stero headphones even though the sound is only mono. There is a good article on the pocket morse trainers in this month's QST magazine. That's the big reason I picked up the MFJ, they had a very favorable review.

I hate to ask, but, did you check the fuses? If those are fine,
you may want to check the diode(s) at the power input inside the
radio. Frequently, if the fuses fails, or if you bypassed the
fuses, these diodes can protect the equipment, specifically from
reversed polarity mishaps. This may be a start.

Good luck.

In an earlier post I asked for help with a transceiver that went dead overnight for no reason. The reason was, as I found out to my relief, amusemet and chagrin, was a desk mike 'lock' switch which was depressed by a marauding tomcat when I wasn't looking. The xcvr will not turn on when any xmit switches are in the 'on' position. All is well. Watch out for cats in your shack!

Message-ID: <NOMSGID_1=3A109=2F239.0_951115_224000_c5ffe6db@fidonet.org>
Source record: 210139

Joe,
I have been using the QRP tuner for about 2 years.
I use it with an MFJ 9020 and my IC-725. There is a switch
on the bakc to toggle between low power 1-30 watts and hi
power. It is fine for a 100 watt station like the 725. I also
use it on 6m, does a fair job. The lower power setting and
cross needles for SWR and Power are pretty good at the qrp
levels - checks out with my watt meter. If you don't have
to run more than 200 watts it is a good tuner. I would be
careful using it on 160m with power levels above 100 watts.
Good luck!

What happens to the plate current during the drop in output? Also,
if you turn the drive to zero and place the unit in SSB transmit mode,
is the resting plate current stable?

If you're not able to monitor the RF at the grids of the finals for
some reason, check to see if the screen, plate and bias DC voltages
on the driver are changing. Also check the grid and screen voltages
on the finals.

>Thanks for all your advice.

I've worked 40m CW from hotel with a TEN-TEC Scout. For the antenna, at one I parked my car in front of my room, and ran coax from the Bugcatcher through the window. I used CW so any RFI won't be readily identified, The other time I was staying for a week, and had a room on the 10th floor with a balcony, I c-clamped my bugcatcher to the steel rail of the balcony, and again ran CW.

Good Luck KI5GY Sparky

Hi Wayne,
Living overseas (where the nights are days and the days are nights, so to speak) I have come up with a device to do this. Basically, I have a stereo-tape recorder hooked into one of those "el cheapo" light timers. It kicks on at 3 am, records the 2 hour NPR broadcast, and shuts off at 5 am. Then, I can catch NPR on my commute later in the morning.

I picked up my timer for about 8 bucks during an after-christmas sale. Found it at Wal Mart, in fact. I think it was designed to turn the christmas tree lights on and off at specified times, or maybe to cycle the lights when on vacation. Anyway, it works fine for my purpose.

Happy listening,
Joe

: Any advice would be appreciated. tks de Lynn
: --

That radio and the 765 have switch mode power supplies. If something in the ferrite power transformer is able to vibrate, you can get sounds at fractions of the switching frequency. Drive a dummy load and vary the power output (Use CW, key down, but don't hold for too long) and you'll be able to hit a number of modes that make different sounds. On SSB, these effects are voice modulated, you may be able to hear a mumbling sort of "monkey chatter"

It's just something you dismiss once you know the cause. The SMPS is fairly efficient and is very well screened and filtered, the result is a lower power bill, a lighter radio, and a radio that runs a lot cooler - needing less fan activity. Internally, everything in the radio is powered from a single 13.8v feed, by the way. Also the fins on the power supply case are scalpel-sharp BEWARE! and the control IC for the supply is obsolete, I think ICOM have some stocks for repair purposes. I laid in a couple of spres for my 765

Cheers
David GM4ZNX

Oh, yes The manual is in error about how to change for 220/240v power - it omits to mention a link UNDER the main input bridge rectifier.

>
> Does this mod affect HF or 6m? After the mod, what frequencies use the LP and
> what frequencies use the HP filter?

The mod affects only frequencies above 60 MHz. If you just cut or remove the yellow wire, the HP or actually 2m bandpass filter is used all the time.

Last night I took the loose yellow wire and connected it to a VCO control switch transistor (?) on the lower PC board. Now I have the LP filter in use between 60 and 129 MHz and the 2m bandpass between 129 and 200 MHz.

There are five SMD transistors on the lower PC board just behind the "MENU" button. The one in the middle controls the VCO that is in use from 60 to 129 MHz. The single pin has 5V when within this range. There is a trace from this pin to a plated-through hole near J6. This is a good place to connect the wire. (I haven't even seen the schematic so cannot say if this is the best way to do it. But it works for me.)

129 MHz seems to be quite close to the cross-over point of the LP and 2m BP filters. Here is a listing of the (NBFM) signal strength needed to "light" the first segment on the S-meter on each frequency:

MHz uV/LP uV/BP
125 .8 2
135 12 .5
145 .15
155 30 .5
165 3
175 11
185 140

After the mod I can listen to the Helsinki airport on 134 MHz but the Meteo on 128.4 is still drowned in intermod from the FM BC band.

> thanks and 73, Cecil, KG7BK, OOTC (not speaking for my employer)

A new tribander is out from Standard: the 568A. It receives a surprising array of frequencies, including 800-1300MHz. Does anyone know of mods for recovering the interesting parts of the 800 realm? I've checked Oakland and can't get through to AD4HL's BBS (at 615-537-6051).

Does anyone have one of these radios? What do you think?

I'd also like to get a general feeling for what people think about the Standard brand.

In the market,
Mike

4218. R5000 Misbehaves

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-16 00:00:00 UTC
From: afpgreg@gatekeeper.ddp.state.me.us
Message-ID: <48fkl8$dtm@web.ddp.state.me.us>
Source record: 210162

My R5000 Rx is acting up.
Simply quits on hot humid days of summer and
then lately its doing the same if I leave the radio unplugged, a regular
practice to prevent lightning or ac spikes from killing the front end.
In the latter, more recent condition, the digital display goes
blank--with decimal points across the display but is revived if I tune up
or down a few kcs. But if left on frequency, it goes blank. Sometimes I can hear
what's on the frequency, but usually all's dead other than some baseline
noise when the af gain is cranked up.
Also, the built-in VHF converter doesn't stay engadged during
these seizures, reverting back to the hf bands for a moment and
then the display quits as explained.
Paul Frustrated. Any diagnoses and presriptions from the group
are gratefully appreciated!

>pruth@alpha.cc.oberlin.edu

I've experienced this problem a couple of times. Even took the
whole thing apart trying to find out what went wrong. Then I
discovered tha the PTT switch on my desk mic was weighted done by
a book. The radio won't turn on if any of the tranmit switches
are on, including the one on the front panel. Once I verified
everything was off it worked on power up. Boy did I feel
sheepish! Hope your problem is as simple.

Boy, if you find out; let us know. I have a Sangean ATS818cs which will start recording at a preset time. But it's a real kludge. Have to set frequency and mode, set record time, turn on PRESET switch, press down RECORD and wait. Most often forget to do it all exactly right.

But it shouldn't be too hard to make such a setup using a receiver with RS-232 control, a recorder with an external start/stop connection and software to control both of them. Anybody know of any applicable software?

Hello,
if you are tired (like I am) of seeing meaningless, ego driven diatribe
posted and crossposted by Burt Fisher all over the Amateur Radio
Newsgroups,
try sending a E-Mail message to :postmaster@ccsnet.com and
postmaster@meol.mass.edu and tell them that you are tired of Burt Fisher
(k1iok@ccsnet.com and fisher@meol.mass.edu) constantly spamming the
amateur radio newsgroups and God knows how many others.(I've allready sent
my
complaint to them)

With any luck they might give Fisher all the attention he so desperately
seeks
and we can carry on our amateur hobby without his meaningless spams :)

One point you may have missed on the Icom 706, it has a built in electronic
keyer. This is done by several commands to the unit and use of the up/down
keys on the mic for keying. No CW key or paddle necessary! Pretty neat!
I got to use it last night, great setup.
The pre-amp is really good.

Tnx to W0RFX for use of his new rig,
73 all Scott N0XZY

4231. WTB: 406-420 Micor or Mitrek

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-16 00:00:00 UTC
From: cole@coltechinc.com
Message-ID: <48eg4f$ru8@nnrp3.news.primenet.com>
Source record: 210175

I am looking for Motorola Micor or Mitrek radios in the 406-420 MHz band to convert into link radios for the ARizona Repeater Assoc sites in Arizona.

The club is putting up some new sites and needs radios which go into the lower UHF region where the link radio freq allocations are... They are hard to find and we are out of what we've been using. Prefer the Motorola radios since we have a bunch of parts and experience using them, but GE radios of the crystal controlled variety will also work.

What ever you have in this range, I'd like to hear about it.

73, Cole AA7RD, Phoenix, AZ

4232. Differences between IC-2300A and IC-2310A?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-16 00:00:00 UTC
From: moyers@cti-pet.com
Message-ID: <moyers.19.0A8FD93B@cti-pet.com>
Source record: 210176

Can anyone describe the differences between the ICOM IC-2300A and the IC-2310A?

Do they allow simultaneous receive of both bands? crossband repeat? remote operation? do they come with duplexer or two separate ant jacks? 800 Mhz receive?

Help?

Clif

An older pager should do the trick; I scrounged some old
(early 80s vintage) Motorola pagers that have neat receivers.
I didn't recrystal it, but I left it running on the bench
on a single AA cell for a couple of weeks... if you need
audio, you'll need to add an amplifier and stuff.

For Sale AOR AR8000 receiver:

Full coverage - 100kHz to 1900MHz continuous no gaps, full 800MHz
coverage
All Mode Reception - AM, USB, LSB, CW, NFM, WFM
Programmable Step Size in 50Hz increments
4.0kHz SSB filter
Alphanumeric multi-line display
Signal Strength bar graph
1000 channel memory bank
computer control I/O port.

Too many features to list. Basically, top of the line receiver with
full coverage.
Purchased in Europe while on vacation, barely used. Price includes
complete unit with
manual. Asking $550.00, I'll pick up the UPS shipping (within the
U.S.).

I'm just in the process of buying a small rig that I can bring to my cottage and in the boat etc. Used to have a FT1000D and had to sell for home renovations, so I'm kinda spoiled.

Which rig would be recommended FT900, TS450 or TS50? I'm a CW fan, so buildt in keyer would be an advantage plus maybe some filters included. There seem to be quite a few FT900's on the used market. Any reason for this?

Any help would be appreciated.

>to reduce the fade with the present radio?
>--
>Wayne Watson

Hi Wayne,
The problem exists with all car radios, but is aggrivated by a lack of AM sensitivity in the aftermarket ones. Most factory AM car radios are designed to present a very high impedance to the antenna, most aftermarket ones are not!

The antenna on your car is a voltage probe on the AM band. It senses the electric field. That makes the antenna couple to a very high impedance source, a lot of voltage compared to the available current. The low radio input Z loads the antenna down by requiring too much current, and that reduces the voltage.

The power lines do the same, they disturb the electric field by "loading it down". So the voltage available at the car antenna is reduced when you are near them!

Mike,
Try running a ground wire to a water pipe. Unless you have
plastic plumbing, the water pipe would be a much better ground
for R.F. then the electrical system ground.

>MFJ Makes a tunable artificial ground. I have not tried it but you
>might check it out

Grounding, artificial or not, is a kludge, a bandaid, and not the
proper solution to this problem. You're getting RF on the rig because
RF is coming back down the *outside* of the coax from the antenna.
Put a choke balun up there at the antenna feedpoint, route the cable
at right angles to the field, and no more RF on the rig.

Unless you're feeding a long wire directly from the rig (or associated
ATU) there's no reason to have an RF ground at the rig. You need a
safety ground, of course, and the 3rd wire connection supplies that,
and you might want a lightning protective ground (which the artificial
ground won't provide), but you don't need an RF ground.

Airplanes and satellites don't have an Earth connection, but their
radios and antennas work fine anyway. Establishing an Earth connection
for stray RF suppression is a bandaid (and can often make the problem
worse instead of better anyway). Stop the RF from straying in the first
place and you won't need to put a bandaid over that cancer.

Gary

From: arahman@cyberus.ca (Ajmal Rahman VE2ZQ)
Subject: FT-102 tx problem

I have an intermittent problem with the tx in my FT-102;the output goes
from full to less than a watt.Have tried changing the 12by7 tube to no
avail.It started out as very int. but is pretty solid now.
Could it be bad or dirty contacts on the band switch or the
famous relays, I wonder. For a while it looked like a component as it
would start to work then die off, but the symptoms seem to change. I
signal traced it right up to the grid of the 12BY7 and it seems ok.
Any input based on your experiences would be greatly appreciated.

>How would I do this?

Assuming you're using a metal mast, and it's clamped to the mast,
just ground the mast. #8 copper to an eight foot ground rod. Use
approved grounding clamps on both ends. If you're using a non-conducting
mast, then place the ground clamp at the bottom of the J in the J-pole
and wire to the ground rod as above.

Subject: Icom 706 - modified advertising! Check web site!

This talk about FM Stereo reception peaked my interest since I'm in the
broadcast industry. I doubt the selectivity nor bandwidth of the 706's IF
filtering will allow enough of the composite signal to pass to properly
decode the stereo matrix. If I'm wrong, you'll need to take a sample of
the composite signal before the discriminator and route it into an
external matrix decoder and detector. Motorola thoughtfully provides
several multi-function IC's to do the job. My personal opinion is it's a
waste of time.

From: yingst@knighted.com (Harry Yingst)
Subject: Mods for Icom IC-736
Date: 9 Nov 1995 23:52:06 GMT
Organization: Knighted Computers
Message-ID: <47u476$les@crier.knighted.com>

Does anyone have any mods for the ICOM IC-736? I'm looking for a way to
turn the pre-amp back on below 1.6 Mhz.
Icom turns it off even though it the light says it's on.
I would like to listen for some lowfer stations 1750 meter band
(160-190 kc. 1 watt into a 50 ft antenna). I'm also looking for a way to
improve the recieve audio.
The recieve audio sounds flat and distant, lacking highs & lows.
With the notch filter ON the audio sounds a little better,
but it still could use some improvement.
They re-shape the audio through the notch filter,
and it actually has a nicer sound with the notch filter on

(Has more highs & lows).
I had a IC-737 that had the same problem with the audio,
just not sounding quite right. I am also interested in any other mods
for the Icom IC-736. Please send any replies to yingst@knighted.com Note:
If you post a reply into this newsgroup I proably wont get it,
my internet provider only holds news for 1 day. Thank You. Harry

>can this rig do and are the accessories available?

Aw gone! AES and Radio City have advertised some remaining band units, but
the radio was disco-ed in 1994. Too bad too, since Icom's "replacement" only
offers the 2/.70/.23cm bands, no choices! (This ain't Burger King, you only
get it OUR way!)
Have to stick with Kenwood if you want/need 6m or 125cm along with the
standard bands in one mobile box.

Subject: PLEASE TAKE MOMENT TO READ THIS

If you want this spamming harrasment stopped, take the time to write a
complaint to the folks who supply Burt FIsher his accounts.

postmaster@ccsnet.com
postamster@meol.mass.edu

Simply state the truth, that Burt Fisher is being abusive, offending, and
basicly a disgrace. Remind them that they ARE RESPONSIBLE to a certain degree
of anything like this that they are aware of, and once you let them know

about it, they are then aware of it.
Have them investigate his postings in the rec.radio groups. Also point
out that his is "Spamming" the net also.

They will take one look, and this will stop.

~~~~~~

Well burt, you did it to yourself.
Dont threaten me with a lawsuit Burt as you always do, I have hundreds of
people who would gladly write me statements that would thrash you in court.
10-4?

Enough said, I will no longer be following this thread.

Sorry to all those that are getting these messages. You wont see any more
from myself.

I recently went through similar problems with my R5000. In the summer
mainly, when it was particularly humid, the frequency would shift from
the tuned value in jumps of exactly 50hz. I also experienced the VHF
jumping back to HF. I took my set to a Kenwood designated repair shop
in Groton, Mass. Two problems were found: 1) the silicone potting
compound used on one of the circuit boards had degraded and was
shorting out intermittently in humid weather (it was replaced with a
plastic potting compound of some sort, and 2) the lithium backup
battery was leaking and the stuff may have got on some of the
circiuts. These repairs cost about $100 including a few new
components and a new battery. If you are interested I can give you
more details and info on the Kenwood homepage on the Web. This also
has a list of all approved repair stations in the US. E-mail if you
want more info.

Cross-posted to: radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.policy,rec.radio.amateur.space

I received a call today from a ham who would not identify himself. I repeatedly asked him who he was, even saying to him that if he had an opinion worth anything it is reasonable to expect he state who he was. Still he he refused. I then commented that he was "so typical ham, no guts." My wife then told me to get off the phone and stop wasting time with gutless hams who hide behind their mikes. As I made one more effort to identify the caller, he hung up. He also made a veiled threat that bad things would happen to me, I retorted I might take it more seriously if he were not a gutless ham.

This call is just so typical of hams, brave at a distance.

KENWOOD TH79A and 79A(D)
NEW MODIFICATION FILE
REQUEST FOR UPDATES AND ADDITIONS
FOR NEXT VERSION 2.0------
CURRENT VERSION AVAILABLE AT
http://oak.oakland.edu:8080/pub/hamradio/mods/kenwood/th79A

Hello everyone,

It has been quite a while since I wrote the original modification sheet for the Kenwood TH79A dual bander. Many of you have written me from around the world asking about a more current document that details the operation and modifications of the unit.

In order to create a newer document, I am requesting feedback from anyone who has performed the modifications successfully or not. It is very important that I obtain a current set of information, or else I will not be able to publish a newer specification sheet.

I am especially interested in those of you with TH79A(d)'s, as I have not been able to get reliable information from anyone regarding the information in the first mod sheets...!!!!!

PLEASE READ CAREFULLY

If you have any information that will be of use to the TH79 mods file, please email

to: cwagar@mindspring.com
subject of: NEW INFORMATION FOR TH79
(NOTE: USE THIS FOR SENDING ME INFO ONLY)

If you would like to receive the newest copy when available, please email

to: cwagar@mindspring.com
subject of: 79A MODS LIST

and the current version is available from:

http://oak.oakland.edu:8080/pub/hamradio/mods/kenwood/th79A

PLEASE do not post responses to the group as I will be maintaining this list through email only. Any new information or solid confirmation of old information will get credit in the new modification file.

Thanks in advance for your help, and 73,

Clayton Wagar

4259. Re: TS-440S/AT Mods/Serv. Notes

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-17 00:00:00 UTC
From: "Thomas C. J. Sefranek" <sefranek@iii.net>
Message-ID: <48istg$dft@news.iii.net>
Source record: 210203

I have repaired several TS-440's with bad VCO's.

The gunk used to pot the components gets corrosive and conductive with age, heat, and humidity. The only fix is to remove the boards affected, (replace them) or scrape off the stuff. This has always been only possible by de-soldering the components. Unfortunately, I have had two rigs needing FETs because their legs were eaten thru! Fortunately, "standard" FETs do the trick. I didn't buy jap replacements.

Count on a very long time de-gunking the boards, as there are (I think) 7 VCO's!

I do have the service bulls.

Tom

4260. Suggestions for 2m mag-mount antenna

Newsgroup: rec.radio.amateur.equipment

I had the opportunity to listen to the radio a bit on CW. The DSP action is indeed noticable in CW. Moreso than in SSB. I was impressed at the amout of noise that was reduced when I activated the DSP in CW. I was impressed...just ordered mine today!

Feroz, 4S7FG/ WU9N

4263. RS. HTX202 What's Wrong ?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-17 00:00:00 UTC
From: pezad@wimsey.com
Message-ID: <pezad-1711951938250001@pm039.bby.wis.net>
Source record: 210207

Whats with the RS. HTX202

This is my second one this year -- failures

The problem is the antenna seems to lose connection with the radio. It doesn't appear to be the antenna as it works on other handhelds just fine. Other antennas don't seem to work on the HTX202.

When the transmit button is pushed the power out LCD display goes full scale and it shouldn't (like no antenna connected). There is little or no radiated power. Very strong repeaters can be heard but very weak, maybe 1 or 2 meter units. It's almost like the metal in the centre of the BNC connector on top of the handheld becomes disconnected. You can get it to work intermittantly by pushing on the centre conductor of the BNC with the antenna off (I become the antenna) or by spinning the rubber duck to certain positions while connected.

Is this a common fault with this rig ? What causes it ?

I have not been too bold in my investigations as it is still under warranty (just).I am concerned though as next time things wont be covered. My first one was replaced immediately, now RS wants to try a repair.I'm not hopefull.

Thanks for any suggests and comments in advance.

4264. DSP100 on Kenwood TS850

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-17 00:00:00 UTC
From: jmp@ipctech.com
Message-ID: <jmp-1711951643550001@jpenderg.ipctech.com>
Source record: 210208

I am looking into buying the Kenwood DSP100 for my Kenwood TS850AT. I am under the impression that the DSP is done at audio and not at I/F as it is in the new Kenwood 870. Even at this, has anyone had experience with the DSP100 as compared to the other generic brands? My main concern is eliminating the adjacent signal hash on 75/40 meters. Advice from actual users would be prefered.
Thanks in advance, john KO4MY

4265. IC706 Audio

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-17 00:00:00 UTC
From: Thomas Brockdorf <tbrock@execpc.com>
Message-ID: <48hclg$sev@daily-planet.execpc.com>
Source record: 210209

There have been reports of "narrow" or "pinched audio on the 706.
I found by adjusting my carrier frequency, (q4 under the quick
set menu), that I can go from a very tinny sounding audio, to a
very rich sound. This is adjustable from -200 to +200.
Around -130, or so seems to sound the best.
This looks like the cure for the reports of "pinched" audio.
Anyone else play with this adjustment?

Source record: 210213

I have repaired several TS-440's with bad VCO's.

The gunk used to pot the components gets corrosive and conductive with age, heat, and humidity. The only fix is to remove the boards affected, (replace them) or scrape off the stuff. This has always been only possible by de-soldering the components. Unfortunately, I have had two rigs needing FETs because their legs were eaten thru! Fortunately, "standard" FETs do the trick. I didn't buy jap replacements.

Count on a very long time de-gunking the boards, as there are (I think) 7 VCO's!

I do have the service bulls.

Tom

4270. Ham equipment is so damn Expensive.

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-17 00:00:00 UTC
From: feliccia@unix3.netaxs.com
Message-ID: <48gnog$ep4@netaxs.com>
Source record: 210214

Has anyone notice how DAMN expensive ham equipment is. Is it just me or
is anyone out there also really discouraged. It is a wonder anyone gets
on the air anymore. I was looking for a mobile HF rig, but any new equipment
will set me back a grand or better. I work as an engineer but I don't
have the cash to squander on something I will use a few hours a week at best.

What can we as hams do nowadays about this? Do we turn to Homebrewing. I am
an EE and I know what it takes to build something. If you have a nice variety
of parts, etching facilities, a 20 MHz scope at least, in short a working
electronics lab you can do it. Otherwiese I feel making anything but a
groundplane is more trouble than it is worth. Do we hand someone we have
never met at a hamfest a week's pay on a bet we'll get a rig that will last.

Does this have something to do with the dollar/yen thing? Is drake still
making trasmitters? I saw a reciever but no transmitters?

These are all pertinent questions to the future of ham radio. What kind
of hobby are we developing? Are we going to price ourselves out of existance?

Lets have a good talk about this.

>think they have any lack of expertise....I don't like it....so I guess
>I'll stick with the radio's that I have.

I have no idea what the term "pinched up" means, but I will note that
the IC-706 has a transmit audio passband of 300 Hz to 2300 Hz which is
a bit too wide. A passband of 350 Hz to 1800 Hz would be better for
effective communications on the crowded HF bands. The excessive high
frequency response produces "monkey chatter" on adjacent channels.
Icom offers an optional narrower SSB filter that is better suited
to the HF channel.

This is true, you can get the RIB and probably the cables from a 3rd party supplier. However, you MUST purchase the software directly through Motorolas americas parts division. They are the only place you can legally purchase licensed copies of the radio service software that you need to program the radios.

>Speaking of HAM radios, could this group help me out? Every time I go and
>dive with my radio set, the fuse blows. What's the trick here?
>

Ah, yes...
There was a time when having a HAM ticket *meant* something...
When a fuse blows consistantly, it's because there's more current going thru the fuse than the fuse is rated to carry. The fuse, being a safety device, blows to prevent this excess current from flowing, possibly damaging something.
Check to make sure the fuse is the proper rating for the gear. Do *not* replace it with a higher-rated fuse! If it is the correct fuse, then the gear is drawing too much current. This needs to be corrected. Maybe it's a short in the power line, maybe the gear is not a boat anchor. Either extreme, and all points in between should be checked, and corrected.
Good luck.
Bill

That's not quite true. The stub still radiates a little in the far field, and is very intense in near field effects. Moritz is correct. If the feedline is mis-handled near the stub it can cause problems!

>}>NOTE: While theoretically a J-Pole is an omnidirectional antenna, You may

It is an asymmetrical FEEDPOINT, and needs a balun or de-coupling of some form when used with any feedline.

>Mike KC7NOE

Mike,
MFJ makes a 1/4 wave mag mount, it is $ 14.95. It works good in
the city, near the repeaters. They also make a 5/8 wave, I think
it sells for $24.95, (from Amateur Electronic Supply catalog).
Radio shack sells a 5/8 wave also.($39.95)
There are also other brands for around $39.00. As far as
performance, one is as good as the other. There are some quality
differences though.
If I diddn,t want to spend a lot of money, I would get the MFJ
5/8 wave.

Hiya - got a question for anybody. I'm a member of Wisconsin Wing, Civil Air Patrol (we look for people who have some trouble landing airplanes, basically.) We use 2 meter frequencies, and I'm trying to get some new equipment to work, with little luck.

I have a Yaesu FT-411E handheld, and I wanted to put it into my car, and the wife nixed my old trusty mag-mount on the new paint. So I have a Larsen Kul-Glass (glass mount) antenna, and it IS the right one (checked several times.) I'm also trying to use a mobile RF amp - supposed to be able to put in two watts, and get 30 out of the antenna.

However, I get very broken up reception, and I'm told that I sound just as lousy, even 1/4 mile away. I can't even hit our repeater from the tallest freeway bridge in the city. I'm stuck and rather annoyed. I've been through all the hookups, and it seemed that this would be a fairly simple sort of install, but it's not working out. I do have some fair knowledge of electronics, from 2.5 years of it in high school, and I'm starting to study for the Technician rating. I thought I'd have a really good and flexible setup, but I'm just out a chunk of cash. Any ideas out there? Thanks!

I believe you have your numbers confused. The IC-725 is Icom's
"consumer" grade HF transceiver. It's the IC-275 that's the
2 meter radio.

Page 22.51 of the 95 ARRL Handbook has a schematic for a Kenwood XCVR to RS232 interface. I may build it myself eventually, but there is a compay that markets an interface for less than $60 (built into the 25 pin connector, I believe), and this may be "the path of least resistance."

Cheers

From: wave@mindspring.com
Message-ID: <48na0t$hc2@firehose.mindspring.com>
Source record: 210057

Yesterday I felt like there had to be a better way of telling the CPU of this radio to do it's job. That is TX on every freq and select the appropiate BP on every range.
I removed all the diodes located to the left and right of D59 (total of 6). I then connected tiny wires from the cpu lines to one side of 6 dip switches through 6 1n914 diodes. The other side of the dip switches connected together to a 10K ohm pull-up resistor. I then tried all 64 combinations possible. I went through all kinds or radio versions, but none of the combinations made the radio switch the BP's appropiately or TX outside the 2meter band. Many of the combinations made the radio an HF only radio (.1-30MHz) and many made it TX outside the ham bands on the 0-60MHz side. The best combination seemed to be what we already have :<
We'll keep trying.

Hi Tom
This is really a reply to your interference problems that signals are hard to copy with the engine running and you can't seem to track it to any particular item.

Check the Fuel Pump located inside the fuel tank. They are notorious!!. I put an inline filter on my Van and fixed it completely!!. I put a split core ferrite on my Montero and it got it to the 99% point and was a lot easier since I could not get to the pump as easily as I could on the Van

Good Luck

Jim

Actually, that changes you between 1 Hz and 10 Hz tuning steps. However, there is a way to get 100 Hz (and several other) step sizes. The fine manual explains it on page 17 as I discovered on rereading it. Just push TS until the marker is over the kHz digit, hold it for 2 seconds, and you're in a menu that lets you select 0.1, 1, 5, 9, 10, 12.5, 15, 20, or 100 kHz tuning steps. Whew! They didn't leave out a thing.

>>For those who like to scan VHF Hi-band, we've discovered a mod that
>>restores sensitivity, but at the cost of reduced sensitivity below
>>120 MHz.
>
>Could you post this mod here or via E-Mail?

This is the "yellow wire" mod, but one of my correspondents has found a better way that actually allows the filter to switch at the corner frequency (apparently around 129 MHz) as you tune. Now PROCEED AT YOUR OWN RISK, there are no guarantees you won't trash your radio, this is reverse engineering with no schematics, Icom doesn't warrantee this mod, etc, but here's the mod anyway. :-)

Remove the radio top and bottom covers according to the manual. Remove the speaker. Now with the radio facing you and right side up, you'll see a single connector with discrete wires at the rear of the control board. The fourth wire from your left should be a yellow wire (caution, the 5th and 6th wires on the other end of the connector are yellow too, don't get confused). Disconnect this wire from the connector. This will enable the 2 meter pass filter outside the 2 meter band, and will restore sensitivity between about

130 MHz and about 165 MHz (above and below that range, sensitivity still stinks, especially above 165 MHz). Before this mod, a low pass filter with a corner frequency around 129 MHz was in the circuit all the time except when you were actually tuning inside the 2 meter band, and that killed high band sensitivity completely. Before removing the yellow wire, sensitivity at 155 MHz was 30 uV for an S1 indication, after the yellow wire is removed, sensitivity increases so that only 0.5 uV is required for a S1 reading. At 165 MHz after the mod, sensitivity is 3 uV for an S1 reading, before the mod, a very large signal (more than I wanted to feed into the radio) was required for an indication.

Disconnecting the yellow wire has the unfortunate side effect of reducing sensitivity between 60 and 129 MHz since the radio never switches from the 2m bandpass filter to the low pass filter. Signals below 60 MHz don't go through either filter and are unaffected by the mod. Now here's how to get the low pass filter back when tuning below 129 MHz. On the bottom board, right behind the MENU button, there are 5 SMD transistors. These transistors apparently switch the VCOs for the various band segments. The one in the middle of the 5 apparently switches the 60-129 MHz VCO. The single pin (one side of the SMD transistor has 2 pins the other only 1) switches to 5 volts when this VCO is active, and is low otherwise. This is exactly what we need to feed the yellow wire. There's a board trace coming from this pin over to a feedthru hole near J8. Connect the yellow wire you disconnected earlier here.

The filter should now toggle between low pass and 2m bandpass as you tune below and above 129 MHz, and you should have good sensitivity both above and below this frequency (at least up through 165 MHz).

Remember, CAUTION WARNING and all that trash. This is tiny SMD stuff. If you trash your radio, you're on your own. Thanks go to our correspondent from Finland, whose call I do not know, who discovered this latest mod, and to WB6JDI for relaying it to me.

A final PS to all you mod freaks. There may be *a better way* than this mod to restore high band sensitivity. If you're a worry wart, or unsure of your skills working with tiny stuff, wait for the schematics and board layouts to come out on the radio. Icom says January. Then we may find a better way. If you're brave of heart, then happy mods to you.

Gary

Does anyone have any mods for the ICOM IC-736?

I'm looking for a way to turn the pre-amp back on below 1.6 Mhz.
Icom turns it off even though it the light says it's on.
I would like to listen for some lowfer stations 1750 meter band
(160-190 kc. 1 watt into a 50 ft antenna).

I'm also looking for a way to improve the recieve audio.
The recieve audio sounds flat and distant, lacking highs & lows.
With the notch filter ON the audio sounds a little better,
but it still could use some improvement.

They re-shape the audio through the notch filter,
and it actually has a nicer sound with the notch filter on
(Has more highs & lows).

I had a IC-737 that had the same problem with the audio,
just not sounding quite right.

I am also interested in any other mods for the Icom IC-736.

Please send any replies to yingst@knighted.com

Note: If you post a reply into this newsgroup I probaly wont get it,
my internet provider only holds news for 1 day.

Thank You. Harry N6VUJ

Howdy! I'm looking for a diagram, schematic, or how-to instructions to build the radio to RS-232 interface for Kenwd radios--in my case the TS-440.

There are lots of posts that describe what it is and that it uses a couple of chips and control programs, but the diagram has thus far eluded me.

Thank you for your attention and support.

: -Mike KS4DA

If your DOS is version 6.20 or later, run SCANDISK to fix the problems in your directory structure. If your DOS is 6.0 or earlier and you have the Norton Utilities, run the "Disk Doctor". If you don't have either of these, run CHKDSK /F. (NOTE: Don't run any of these under Windows; exit to DOS first.)

You will probably get some "cross-linked clusters" and/or "invalid directory entries", which the above utilities should fix by storing the bad data in text files in the root directory (C:\). You will probably have to delete these, but you could TRY a text editor to see what's in them first. You may get some "bogus" directory entries that are not cleaned up even by the above programs. If this happens, get everything out of the directory that you can, then enter the dreaded "DEL *.*" command.

While you're at it, you should also look for temporary files and delete these wherever they're found (enter "DIR /S/P *.TMP" while in the root directory to see where they are). Delete anything else you KNOW for SURE you either don't need or have another copy of, and then use DEFRAG (in DOS 6.20 or later) or SD (if you have Norton Utilities). There's also a similar function in PC Tools, but I don't remember what it's called.

Possible causes of your problem include turning off the system or hitting <Ctrl>+<Alt>+<Del> with Windows still running, power failures, and some primitive viruses, so a 'virus scan' might be in order as well.

If the series of suggestions above doesn't fix your problem, you may need to back up your data, kill the disk partition with FDISK, then reload DOS, Windows, applications, and then your data. Feel free to e-mail if you have more problems/questions/etc.

Nick Feliccia wrote:

> Has anyone notice how DAMN expensive ham equipment is.

Well, it costs about the same as always, but you get a whole lot more for your money. I have an Allied Electronics catalog from 1964; they used to sell all sorts of ham and CB equipment. A Drake TR-3 went for around $300; that's 1964 dollars. Adjusted for inflation, that's about $1k in 'today' dollars. And what you got was a tube radio that would transmit and receive, and that's about all. No general coverage, no memories, no scanning, so signal processing. The tubes were noisy and burned out all the time, and the set weighed a ton and required an external high-voltage supply to boot. Most of today's rigs cost about the same, and do lots and lots more. Even a high-end rig like the Yaeus FT-1000D at around $4k compares very favorably in price (inflation adjusted) to high-end Collins or Hallicrafter equipment in the '60s. Get this: a 23 channel CB set cost $250 in 1964; that's almost a grand for a *CB set*!

Mike, N4PDY (been a ham since 1964, so I should know!)

You need an 8251 USART and a 4040 CMOS counter to go into the TS440.
You can get these at most any mailorder parts outlet for well under $10
Kenwood calls this the IC-10 kit and sells it for much more.

4330. Johnson 450 RCC conversion?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-20 00:00:00 UTC
From: carndt@netcom.com
Message-ID: <carndtDID4JF.838@netcom.com>
Source record: 210012

I have a few Johnson 450 UHF RCC 14 channel synthesized full duplex tranceivers. (No control heads, they were RYDAX mobile phones, and are long gone)

These look well built, similar to comparable GE or Motorola trunk mount radios. I have a manual on order.

Has anyone converted one of these to amateur service? If so, I'd like any pointers you may be able to give. Seems like one would make a nice portable repeater.

73,

Chris

If you can't find or figure out the manual, you will just need a good
amount of time and patience.

If you just need it done once or twice, pay some tech a few bucks under
the table to program it for you

4336. IC706 Info

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-20 00:00:00 UTC
From: steveg@kcbbs.gen.nz
Message-ID: <3695323.572.25177@kcbbs.gen.nz>
Source record: 210071

Forgive me as I am kinda new to this but, I would like some info about
the IC706. I understand that it will xmit on anything below 54Mhz?
and 144-148Mhz?
What are its receiving ranges?
And one other thing - why do you somethimes express frequencies in
Hz and at other times in Metres? sound waves travel at the same speed
all the time, so fo a given wavelength ie 2m the frequency will always
be the same so why not stick to expressing it the same way?
Is the IC706 good as a scanner but has the ability to xmit as well?
ie does it recieve a wide range of frequencies?

Regards

Al

Hello there,

I also own a Standard C568. I also own the service manual. I am very
satisfied with the radio.

Receiver is wide on all bands. Its able to scan the (european only?)
930-932-phone-area. RX sensitivity on 23cm is also good.

For 23cm I use a power amp designed for a packet radio interlink tranceiver,
it boosts up to 15W and is easy to be built.

4346. Re: Ham equipment is so damn Expensive.

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-20 00:00:00 UTC
From: James Garland <garland@ohstpy.mps.ohio-state.edu>
Message-ID: <48qfh1$iih@pacific.mps.ohio-state.edu>
Source record: 210081

It doesn't seem to me that the days of homebrewing equipment have passed. True, it is unlikely that most hams could duplicate the complexity of modern Japanese SSB transceivers, or would want to even if they had the knowledge. However, much of the circuit complexity in these radios contributes only to bells and whistles, many of which are seldom used and many of which only make the radios user unfriendly. One shouldn't have to wade through nested menus of options to select functions, or be forced to enter routine freqency selections into a keypad, or to figure out which of dozens of buttons to press when wanting to switch filters or do something simple. Users shouldn't have to put up with tiny closely-spaced knobs (usually dual concentric), and dozens of identical looking pushbuttons on a black-on-black panel. I'm afraid we have all fallen victim to advertising campaigns which tout "features" but ignore convenience.

The point is that one doesn't have to duplicate all the frills of these radios to design and build truly high-performance receivers, transmitters and amplifiers. Modern integrated circuits provide wonderful easy-to-use building blocks, and any ham who is willing to study a bit can acquire the skills to use them. Furthermore, there is a large amount of 1970s-80s test equipment available at flea markets and elsewhere, so one can outfit a complete workshop with lab grade equipment (Tektronix scope, Wavetek signal generator, HP bench supplies and rf voltmeters, etc.) at far less cost than one Japanese transceiver.

I have been interested in the resurgance of A.M users in the past few years. These hams tend to be quite knowledgable about technical matters, and often build their own transmitters. They tend to like the receivers from the vacuum tube era, not so much because they dislike solid state electronics, but because the old receivers were more fun to use and much easier to tinker with. I've learned that A.M. is not an "obsolete" mode, as I had once thought, but actually can be implemented with some very sophisticated circuit concepts.

In any case, it seems to me that the spirit of homebrewing is still alive and well.

I wonder if anybody can help?

I've recently aquired a DENTRON RADIO Co. RF AMP.
Model No. MLA-2500B.

I'm trying to find the recommended input power for the amp. and also trying
to find any schematics for the beast!

Thanks in advance.
Jeremy.

: I have no idea what the term "pinched up" means, but I will note that

Yea, What is pinced up??? Changing the carrier frequency would be the same
as changing the rit so your pitch is different. I have a 706 and got
great reports. When compared with my ts940 which has a desk mic. the 940
had more low freq. audio of course. Perhaps that little mobile mic
on the 706 is delibertly narrow...

>

I don't know if it is a common problem or not, but I have had the same
problem with my HTX-202. In my case, it was already out of warranty.
On mine, it turned out that the center contact of the BNC connector
(on the rig, not the antenna) bacame spread apart until the center
pin of the antenna didn't contact them anymore. I could twist the
antenna around and it would sometimes make contact for a while.
Since mine was out of warranty, I first looked at changing the
connector. This is not too bad, but requires the right kind of connector.
As a temporary hack to get it working until a new connector can be
found, I took a double-BNC connector and pushed the center pin out,
built the end diameter up a little with soft silver solder, then did a little
filling and test fitting until it was a snug fit in the radio connector. I then
pressed the pin back into the connector and with a BNC barrel used this
between the rig and antenna. I haven't had any more trouble with this.

I think the problem is that the RS antenna is so stiff, that any bending of the antenna translates to the BNC and bends the center contacts out. I bought a new very flexible antenna for mine to reduce the forces on the connector. Since your rig is under warranty, send it back to be repaired, then get a new antenna which is flexible. If you get it fixed and continue to use the stock antenna, it will probably happen again.

OK. OK. Pinched up is where you put your forefinger on one side of your nose, your thumb on the other side, squeeze, and then talk. That's what you sound like on the air. If you like it that way, fine. The guy said: "I just bought a new IC706...how does it sound?" I said: "You sound all pinched up." He said: "Well how about now...I just set the carrier point to minus 200?" I said: "Uh..better, more like you, but still a little high pitched or pinched up." That's it. That's my whole IC706 experience.

REVIEW: The Pocket Guide to Collins Amateur Radio Equipment 1946 t0 1980
by Jay Miller, KK5IM

Collecting Collins amateur radio equipment has now come of age, with the publication of Jay Miller's Pocket Guide to Collins Amateur Radio Equipment which covers radios and accessories produced from 1946 to 1980. This is an extremely interesting period in the development of the radio art and the beginning of the Single Sideband era, as seen by the many models developed and marketed by the Collins Radio Company of Cedar Rapids Iowa.

Jay dedicted the Collins Guide to Art Collins W0CXX (SK). He notes in the beginning that the Guide is not a history of Collins Radio nor is it a technical treatise on radio engineering as applied to their equipment. It is, he states, intended to provide the Collins user, collector and enthusiast with a complete pictorial guide to the amateur radio equipment produced from the end of the Second Warld War to 1980.

As a Collins owner/operator continuously since 1967, I have always enjoyed using my KWM-2A and keeping it maintained. This is about my level of technical competence. I also own a 75S-3C, 75A-4, 51S-1 and a military surplus KWM-2A that is awaiting my attention. When I heard about the Collins Guide I was most anxious to see it.

Jay and his associates, including Contributing Editor Butch Schartau K0BS did not disappoint me. The Guide is indeed pocket sized and is wire-bound which means that it will lay flat on a table. Both front and back covers are laminated for durability. Equipment is arranged pretty much in chronological order with professional-quality photographs and illustrations along with descriptions and information about the piece of equipment shown. There's a beautiful picture of the famous KW-1 transmitter on page 22.

The Collins Guide also includes some technical information, such as rear panel collections, crystal information, tube lists of A-line and S-line equipment and information on mechanical filters.

As mentioned earlier I was very pleased with the Guide. It is indeed a beautiful job! It is an important reference work as well as an easily read pictorial history of one of the major players in the development of ham radio communications technology and folklore. I consider the Collins Guide to be an essential information source for anyone wanting to know more about these wonderful radios!

4360. Mods for Icom IC-736

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-20 00:00:00 UTC
From: yingst@knighted.com
Message-ID: <48qtld$9uv@crier.knighted.com>
Source record: 210095
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Does anyone have any mods for the ICOM IC-736?
I'm looking for a way to turn the pre-amp back on below 1.6 Mhz.
Icom turns it off even though it the light says it's on.
I would like to listen for some lowfer stations 1750 meter band
(160-190 kc. 1 watt into a 50 ft antenna).

I'm also looking for a way to improve the recieve audio.
The recieve audio sounds flat and distant, lacking highs & lows.
With the notch filter ON the audio sounds a little better,
but it still could use some improvement.
They re-shape the audio through the notch filter,
and it actually has a nicer sound with the notch filter on
(Has more highs & lows).

I had a IC-737 that had the same problem with the audio,
just not sounding quite right.

I am also interested in any other mods for the Icom IC-736.

Please send any replies to yingst@knighted.com

Note: If you post a reply into this newsgroup I probaly wont get it,
my internet provider only holds news for 1 day.

From: James Garland <garland@ohstpy.mps.ohio-state.edu>
Message-ID: <48qtha$2kr@pacific.mps.ohio-state.edu>
Source record: 210096

My DVS2 digital recorder seems to lock up frequently. I use it on my FT1000D, and find that upon powering up the FT1000D the DVS2 is frequently completely unresponsive. THe only "cure" is to reset the microprocessor in it, which erases all my stored messages. I've tried bypassing the DVS2 pwr supply line, and adding additional filter capacitance, but these steps don't seem to work. A year or so ago, I contacted YAESU service, but they didn't have any suggestions as to the problem. A friend has the same problem with his DVS2/FT1000D. Anybody out there got any suggestions???

Amateur Radio Station Equipment for sale:

Moving into development SALE......

1. Yaesu FT-767GX with 2m module, 6m module,
desk mike and backup battery mod $1300

2. Heathkit SB-2200 2KW Linear Amplifier(Covers 17m) $500
(Includes 2 3-500Z tubes)

3. Cushcraft A50-5S 6M 5 element beam antenna $100

4. Mosley 5-band HF 3-element beam TA-53-M(18Ft boom) $480

5. Telex HAM-IV rotor,controller and 150' (8448) control cable $350

6. Belden 8214 coax, 300' in 2-150' pieces $90

7. Rohn HDBX-40 40' 18 sq ft wind-load tower with tilt-over base,
15' aluminum mast, rotor plate and thrust bearing. $550
All hardware included.

Note: All equipment excellent to new condition and working.
All antennas working and dissembled for shipment.
Delivery of large items to local area included in price.
Prices and delivery are negotiable.
Inquire for price on complete package and local area info.

Would like to sell everything at once as complete package.

My location: south central Pennsylvania. Delivery approx 125 mi radius from my location

I am amazed at the number of hams who complain about the high cost
of ham equipment. Obviously, most of them must be newer hams, because
any of us who have been in the hobby for 15-20 years or more remember
what the price of ham equipment used to be. Back in the mid to late 70's,
my
dream rig was the Kenwood TS-820. I knew that I would have to do some
serious saving for that one, because it was just under $1K, and my groos
pay per month was less than that. It was big and heavy, but you could
take
it mobile if you bought the DC inverter for another $200.00 or so. It
had no
memories, or scanning capability. It had 1 vfo, but you could buy an
outboard VFO for another couple of hundred, so you could split VFO's for
working DX. I also got the bug for one of those 2m mobile radios a
little later.
Kenwood came out with their TR-2400 10 watt mobile radio, that was
synthesized! No memories, no scanning, no touchtone mic, and it was
about
the size of the new Icom 706. It was only $429.95 if you shopped around
a
little. How many of you would pay $400.00 for a 10 watt mobile with no
memories today? Not many, I would guess! You can buy 2m mobiles that
are not even in the same league for under $300.00 in 1995 dollars.
If you want to talk about coax cable, antennae, books, and other
items
related to ham radio, I won't argue the point. They have gone up a great

deal. But so have most other things we buy in our daily lives.

>j (kc5jpf - lafayette, la)
>

Don't know if this will be much help, James. The Icom Instruction Manual doesn't show them in the top and bottom views of the chassis. The schematic shows one variable resistor, R89, that goes to Q20 which is Mic Mute. There may not be a separate resistor for deviation per se. I don't know for sure. I have owned two 25's and two 28's and have never found the need to mess with the factory settings, so proceed at your own risk.

Have you tried a substitute mike? Even if the deviation was a tad low, that should not account for the muffled audio. Hope you solve the problem soon. The Icom IC-28A and 28H are great little rigs. I only have the 28H now, but I will never sell it.

>Forgive me as I am kinda new to this but, I would like some info about
>the IC706. I understand that it will xmit on anything below 54Mhz?
>and 144-148Mhz?

Well, you can mod it for out of band operation, but it really can't
transmit *properly* everywhere below 54 MHz. The output filtering
is only good on HF, not on MF, LF, or VLF.

>What are its receiving ranges?

It will *tune* from 30 kHz to 200 MHz, but sensitivity isn't usable
throughout that entire range. There are mods to expand the frequency
range of usable sensitivity, but they basically stop around 165 MHz.

>And one other thing - why do you somethimes express frequencies in
>Hz and at other times in Metres? sound waves travel at the same speed
>all the time, so fo a given wavelength ie 2m the frequency will always
>be the same so why not stick to expressing it the same way?

Tradition. When we talk about amateur bands, we traditionally refer to
them by wavelength. When talking in more general terms, we'll usually
refer to the frequency range instead.

>Is the IC706 good as a scanner but has the ability to xmit as well?

No. It is a good transceiver that can also do a limited amount of
out of band scanning.

>ie does it recieve a wide range of frequencies?

Well, yes it does, but not all of them equally well. It's not designed
to be a scanner. It's designed to be an amateur radio transceiver, and
it's a pretty good one considering its size. It can be made to work after
a fashion outside the amateur bands, but that's not its primary purpose.

If you're interested primarily in a scanner, there are much better
purpose built scanners, with wider usable frequency range and better
scan programming capability, and for a lot less money. If you're primarily
interested in a good small amateur radio transceiver that can also receive
outside the amateur bands, then the IC-706 may be what you're looking for.

> the city, near the repeaters. They also make a 5/8 wave, ...
> If I diddn,t want to spend a lot of money, I would get the MFJ
> 5/8 wave.

I took exactly this sort of advice from my ELMER who drives nice low cars.
You may like me decide you need both.

If this truck is a TRUCK, check the clearances of bridges & parkway
warnings before committing to having ONLY a 5/8wave. It's much easier to
flip a mag-mount with a 5/8-wave lever arm than with a 1/4 wave lever arm.
(2m*40in/m*5/8 = 50" whip) + coil + magnet + truck = tall.

My van stands stands 6'0" tall fully inflated and can squeeze into most
parking garages, and since it has windows & extra seats has passenger
plates is allowed on the local car-only parkways which have 10' limits
and 9'6" giraffe catchers on the ramps. However, those lowest giraffe
catchers clean my clock every time with the 5/8 wave, although the
bridge-tickler doesn't actually strike any bridges. If the 5/8 had a
shorter loading coil, it might just barely fit, but ... I think I'll be
getting an MFJ or R/S 1/4 wave for city driving and tuck the 5/8 wave
in the back for use out in the boonies when I need the gain.

(In the meantime, I've found *one* ramp I can use to get on for my morning
commute's alternate route if I angle it right, as long as I use the
center lane at the next turn!)

I want to clean off my hard drive and rebuild it. But when I go to copy certain files from the HD to a floppy sometimes I get the "file does not exist" ....well, it looks like it exists to me! Also, while copying files out of one directory, once it gets to the last document, sometimes it will start copying files from OTHER directories as well! What in the world is going on? Am I doing something wrong...Any advice is appreciated.

Sorry Nick,
My Netscape doesn't know about tabs, so I sent 3 blank
postings.

NOW...

Why is it so expensive??? Why do you NEED such fancy stuff?
I am constantly building radio related stuff, which is missing the
fancy bells and whatevers, but it works! (Most of the time...)

Perhaps I'm too far gone on the OF route, but I built my rigs for many
years, I built my mobile power supplies for the tube type radios,
I built ...you get it... and still do. And every monday night I
encourage hams to come over and ... build!

When I just can't live without the new rig with all the bells,
then I realize it will cost me either an unreasonable amount of time,
or a health drain on my financial resources. Thats the choices you make.
Do you have more time or money? And PLEASE, don't get going on the worn
out line of "Ham radio equipment is SOO over-priced!".
IT ISN'T!!! In the last 38 years I've been a ham the prices have gone
down and the modern radios are very much better.

As for the cost of building...
I am today throwing out a truck load of stuff, because too many hams
don't want to be bothered with taking the time to learn, build, repair.
The price is right on monday nights!

I'm not saying you should build the fancy rig for the car, but antennas,
tuners, power supplies can be build (Better) for less than you can buy
them with a bit of forsight, and some planning, and patience.
I suspect your problem is... (Quoting from an actual request I got last
night...) "Do you have a spare (free) 20 amp 12 volt supply"...?
"No I don't want to build it..."

Again, prehaps I'm just too far gone an OF.

I hope you will read this as constructive.

I just purchased a Ford Explorer and am looking into installing my
FT5200 and DX70T.

I have a mag mount but it will definately be a tree trimmer. Also, I
park in a ramp garage at my office bldg. Not a real bunch of choices.
Therefore, I decided to forego the underground parking and give up my
garage here at home and use the mag. But, I can tip it when I DO want
to park inside. As to the DX70T, I am gonna 'gasp' _DRILL_ a hole in
the side (against the XYL wishes) and mount the Hustler mast on a ball
mount. What the heck, the Explorer is for off road and will get
scratches anyway.

4382. TS940S Firmware Upgrade?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-21 00:00:00 UTC
From: wme@austin.ibm.com
Message-ID: <48r8r0$nqq@ausnews.austin.ibm.com>
Source record: 210017

I recently noticed a bug in Kenwood's TS940S computer control firmware.
If you issue the AI command which requests status info to be sent
automatically whenever the xcvr status changes, and RIT is on with a
non-zero offset, the transceiver is slow switching to the transmit freq.
So, on CW for example, you'll get a short "blip" on the receive freq.
If you're operating CW in break-in mode, the signal sounds pretty ugly.
This can also happen when making read-only queries to the transceiver and
the query is being processed when the xcvr is switched to transmit mode.

Are there any updates to the original Kenwood TS940S firmware?

In article <DICwon.E2y@iglou.com>, n4lq@iglou2.iglou.com says...

>Yea, What is pinched up??? Changing the carrier frequency would be the same
>as changing the rit so your pitch is different.
^^

Not quite. Changing the carrier frequency on TX allows you to select which 2.4KHz window of your voice you transmit.(if you are using a 2.4KHz IF filter). It is in essence a TX IF SHIFT
not a XIT.

If your radio has an IF of (Fo) MHz and a Audio frequency response into the balanced modulator
of .1 to 3.0KHz then your DSB signal into the IF filter would look like this:

(Fo-3.0KHz to Fo-.1) (Fo) (Fo+.1 to Fo+3.0KHz)
LSB Sup. Carrier USB

^ ^
|_____________________________________|
2.4 KHz SSB Filter
Can be centered anywhere on this signal.

This signal goes into your SSB filter which is 2.4 KHz wide (IC 706).
Now, by changing the local oscillator frequency you can select which 2.4 KHz window of this signal
you actually transmit.
If you "park" the DSB signal right in the middle of the SSB filter, you would transmit 1.2KHz
of both LSB and USB as well as your suppressed carrier. A person on the receive end would not
be able to clarify this signal.Your signal would then look like this:

RF : (Fc-1.2KHz) (Fc) (Fc+1.2KHz)
LSB Sup. Carrier USB

All of the audio frequencies above 1.2 KHz have been lost and cannot be reconstructed no matter
how you tune the RIT on the receiver.

If we now put the lower left side of the filter at Fo+.5KHz we would transmit an USB signal consisting
of audio frequencies from .5 KHz to 2.9 KHz. (we have lost everything below .5KHz)

Placing the left side of the filter at Fo+.7KHz would transmit an USB signal consisting of audio frequencies from .7KHz to 3.1 KHz. (we have lost everything below .7KHz)

The transmitted information is all the receiver has to work with. If there are frequencies missing the
audio will sound unnatural no matter how you clarify it.

4392. Re: Any Yeasu FT-1000MP Reviews?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-21 00:00:00 UTC
From: "John T. Young" <jtyoung@u.washington.edu>
Message-ID: <Pine.PTX.3.91j.951121082041.26289A-100000@carson.u.washington.edu>
Source record: 210027

Kory, I had a chance to compare the Yeasu Ft-1000MP side by side with the Kenwood TS 870 at ARS in Seattle, switching instantly between rigs to listen to the same signals. For the extra $300 that the Yeasu costs, in my opinion it is a much better radio and worth the extra cost. It has 117 VAC or 12VDC operation options (i.e. built in ac pwr supply); the receiver appeared more sensitive to my ears and had better tonal qualities; the DSP provided more options and was much more user friendly, at least on the first tries. I did not compare the two transmitters in the rigs. The word out here is that the FT-1000D is still more of a radio than the 1000MP, but it's also over $1000 more expensive. I've got a Kenwood TS-850, which I love dearly, so I'm a Kenwood fan. But my next radio is going to be the 1000MP. Best luck with your new rig! 73 de John, KI7JB.

>pinched up." He said: "Well how about now...I just set the carrier point
>to minus 200?" I said: "Uh..better, more like you, but still a little high
>pitched or pinched up." That's it. That's my whole IC706 experience.

Oh, Ok, I've got it now, lack of a deep ballsy resonant response. I'm not surprised that resetting the carrier point didn't result in natural speech either. The "problem" is the hand mike. It has a very "tailored" response, and won't let people with deep resonant voices sound very natural. But it sure helps intelligibility in a noisy auto, removing most of the road rumble. Icom sells an adaptor cable that'll allow you to use any of their 8-pin mikes on the radio. The SM-6 should make your friend sound more natural.

I've gotten unsolicited complements on how natural the audio of my IC-706 sounds, but then I don't have one of those big resonant radio announcer voices. Most Japanese don't either, which is why we keep getting these tailored response microphones on newly released radios. They sound good to the Japanese. After enough complaints filter their way back to Japan, they may alter the microphone response for the US market radios (Yaesu just did for the FT-8500). They seem to have to relearn that same lesson over and over again when they release a new microphone here. I'm also rather soft spoken, and I noticed I had to set the mic gain all the way to the top to get any ALC action. Putting the SM-6 I normally use on my IC-735 on the IC-706 nearly blew the ALC indicator off the scale. As Heil is fond of saying, the right microphone for your voice characteristics can make a huge difference.

Gary

}
}>}>7. Route the coax and tape it to the mast to make it look neat.
}>}
}>}He does not realize that the feed line can interact wit the stub,
}>}and therefore it should be brought out at a right angle.
}
}>The radiation point for this antenna is well above the feed. Attaching
}>the coax to the antenna changes little.
}
}That's not quite true. The stub still radiates a little in the far field,
}and is very intense in near field effects. Moritz is correct. If the
}feedline is mis-handled near the stub it can cause problems!

Sorry, not my experience, I have built several of 3/4 inch copper
pipe for emergency communications use and
have never had a problem. I tested each one extensively first.
The only time I would ever expect to see a problem is if:

1) Using a balun which actually upsets the feed as it will try
and force the currents to be the same in the stub legs, or
force the currents to be the same in the coax. (See below)

2) If the coax was routed up the antenna instead of down.

3) The dimensions of the antenna and stub are incorrect.

The antenna is cold at the bottom of the stub. by it's nature,
the stub should not radiate.
Currents are out of phase and radiation is cancelled.
Again I repeat, the radiation center for this antenna is at the center of
the half-wave section above the stub, although there will be some
leakage, it is minor. There is some asymetry to the pattern, but
again it is minor.
}
}>}Theoretically the J-Pole is an antenna which requires a *symmetric*
}>}feed. Using it without a balun does create problems, although not always
}>}noticed.
}>
}>This is not a balanced antenna and does not need a balun, it will only
}>introduce loss.
}
}It is an asymmetrical FEEDPOINT, and needs a balun or de-coupling of some
}form when used with any feedline.

You just contradicted yourself. Your last statement is true. It is asymmetrical, or unbalanced. If the feedpoint is asymetrical, the antenna system is. Besides, look at it, what is symetrical, there is nothing symetrical about this antenna. It is an end fed half-wave, no symetry here.

A bigger worry is inductive effects of the feed system. I found that using the coax as the "feed lines" limited the SWR floor that was obtainable. When I fashioned a bracket with a connector on the shield side and used 3/4 to 1 inch wide copper flashing or shim stock for the "center conductor," I was able to achieve a much better total SWR bandwidth for the antenna. Instead of having 1.5:1 in the middle and over 2:1 at band edges, I have 1.05:1 in the middle and 1.3:1 at the band edges. This also requires careful (tedious works here too) adjustment of the radiator length and the exact feedpoint tap on the stub. These details are very important. Just because this is an unbalanced antenna, doesn't mean you can ignore the feed system, indeed by doing a sloppy job here, you can increase your chances of stub radiation and feedline problems. Proper handling of the feed ensures that it is in harmony with the antenna.

It is also advisable to use quality coax. I use RG-400, which has a double woven shield. (RG-400 is an RG-58 size coax, which is also constructed using teflon insulation and dielectric. The wires are also silver plated. Yes, it is expensive!)

For those who would want to eliminate the last of the pattern asymetry it is necessary to have the stub constructed in a manner that surrounds the rest of the antenna. Like a quarter-wave sleeve choke. (beginning to look more familiar now?) Feed and adjustment becomes physically challenging though.

4396. Re: Any Yeasu FT-1000MP Reviews?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-21 00:00:00 UTC
From: harp@bnr.ca
Message-ID: <48t5k1$hfi@nrtphba6.bnr.ca>
Source record: 210031

From: john.devoldere@eunet.be (John Devoldere)
Subject: TWO WEEKS WITH THE FT1000MP

TWO WEEKS EXPERIENCE WITH THE NEW FT1000MP

I have had the opportunity to evaluate one of the FT1000ZD rigs that are sponsored by YAESU to be taken along to the HEARD Island DX-pedition in November.

I have seen a few rumors about this new radio on Internet, but no "real life" reports, so this may be interesting to all of you.

The FT1000MP weighs only 15 kg (33 lbs) vs. (ask your back, it will remember) some 25.5 kg (51 lbs) for the FT1000ZD. Great! It has a switching mode power-supply (no bulky heavy transformer), and the PA voltage is 13 Volts (vs. 28 V for the FT1000D). Hence the 100 Watt output power. But nowadays you can drive two 3CX800's pants off with even much less than 100 Watts, so I do not see the 100 Watt power limit as a disadvantage.

The FT1000MP looks very much like the FT1000D. The two large VFO knobs are in the same place, as well as the band keypad. In the FT1000MP you can now individually select the IF filters in each IF (8.125 MHz and 455 KHz), just like in the TS-850. Five selectivities are provided: 250 Hz, 500 Hz, 2.0 KHz, 2.4 KHz and 6.0 KHz.

The FT1000MP not only has (like the FT1000D) a separate receive-antenna input, it also has two different transmit antenna outputs, selectable from the front panel (maybe good for something, don't know what yet...).

The good old analog moving-coil S-meter is gone. It had to happen some day. But now the sub-receiver also has a LCD-bar S-meter. Both are peak-hold meters, where the hold time can be adjusted from 0 to 2000 mS. Nice feature.

The display panel looks a little crowded, but shows a lot. You can (to a certain extend) even program what you show on the panel! It even has an RTTY/Packet tuning indicator, but that's just a gadget.

Lets' talk about what makes a good radio: a good receiver. The FT1000MP has three different RF amps stages! One is designed for the low bands (160, 80 and 40), and is optimized for strong signal handling. The second is optimized for noise-figure (maximum sensitivity) and is used on 24 and 28 MHz. The third amplifier covers the remaining bands. This third amplifier can also be selected to cover all bands. With the big 40 meter yagi pointed at the Eastern European Megawatts on 40, I did notice some difference between the "general purpose" preamp and the low-band optimized pre-amp. Even without IPO (which means switching off the pre-amp) or inserting

attenuation, I could not detect any trace of intermod on 40 using the special preamp. With the general purpose preamp, I could hear a slight trace of crud.

A vast improvement over the FT1000D is that you no longer have to turn a knob (the RX MIX) to switch from main to sub receiver audio. A small push-button (AF REV) does the trick. Simple but efficient.

Then there is of course DSP. YAESU calls it EDSP (Enhanced DSP ...). It works on the last IF, on the detector stages and on the audio stages on receive, and also on the microphone preamp chain on transmit.

On transmit one can select from four fifferent pre-emphasis curves. The cheap sounding hand-held mike that comes with the FT1000MP (sounds basy, hollow etc.) is turned into a Heil like mike with the EDSP. On the air tests confirmed that no difference could be found between my Heil boomsetr mike and the hand-held with EDSP!

On receive, there are two concentric knobs that control de DSP function. One selector allows you to choose between 4 different noise reduction algorithms (optimized for either random noise, QRN, man made noise etc.), while the other knob selects 4 filter options: band-pass, high-pass, low-pass or band-reject. The FT1000ZD DSP works at least as good as any of the external DSP filters I have so far used at my station, and is of course much more convenient to use, as it is controled by one of the microprocessors and automatically adjusts itself to the operating mode (CW, SSB, RTTY etc). The DSP of course also eliminates any number of carriers that may pop up in the pass band on SSB.

A very large number of operating parameters can be adjusted by the operator from the front panel by microprocessor control (similar to TS850). When doing so, the diplay panel shows the parameters in the frequency display windows, while adjustments are done by the two VFO knobs and the memory slector knob. Most of the parameters can be adjusted "real time". This for instance allows you to select the best audio pre-emphasis curve for your particular voice and microphone. You can also adjust the transmit-receive switching times to match you amplifier in QSK operation. Together with a good monitor scope this allows you to adjust the setup for fastest response without relay arcing. You can even shift the carrier position on the IF-filters to your taste! In total 81 parameters can be adjusted with this method.

Despite all of this, the FT1000MP still is a radio, and not a computer. If feels very much like the FT1000D, and its operating convenience is identical or even better.

The FT1000MP has a full-fledged CW keyer built in (full weight control, automatic letter spacing, number insertion for contests, and 10 message buffers). However, the control of these buffers is done from a keypad which is NOT provided with the FT1000MP, and which is not even an option (yet ??). But it is is very easy to construct, and details are given in the manual. One great improvement, is that the CW pitch is adjustable (in 50 Hz steps)

from the front panel (from 300 to 1050 Hz). Changing the pitch automatically changes the relevant frequencies of the DSP filters etc. (everything is "gang-tuned"). The FT1000MP now also has selectable sideband on CW (nice feature!), which was first introduced on the TS850.

The FT1000MP is excellent on the digital modes. The EDSP filters work very well on RTTY. All usual tones and shifts can be selected through the menu selection method as described above. The FT1000MP also has FSK input.

The connectors and pin-outs on the back of the FT1000MP are 100% compatible with what is used on the FT1000D. The transceiver also supports the digital voice keyer DVS-2.

The FT1000MP has a built-in level-converter for the CAT interface. A 9-pin (DB9) connector is provided for direct connection to a serial port of the computer. However, the instruction set for the FT1000MP is NOT the same as for the FT1000D. This means that the FT1000MP does not work with the current software programs that work well for the FT1000D. YAESU USA (Chip Margelli) is aware of this, and I have been told is working on it.

When you open the FT1000MP, it is amazing how much less crowded the radio looks than the FT1000D. The big wiring harnesses that connect the PC boards are gone. One small wiring harness is all what's left in the bottom compartment. Many boards are however connected with flex-prints. The new FT1000MP looks like a well engineered piece of equipment. The diecast aluminum front panel has been replaced with a plastic cast front panel, whick is likely to be more scratch resistant than the painted panel from the FT1000D. The styling is very nice, and follows the latest trend of curved lines and shapes that we witness in the car industry!

Conclusion: the FT1000MP is every bit as good or better than the FT1000D. It has a very quiet receiver, and the ESDP makes it even quieter! It produces excellent audio on SSB,and a very nice keying waveform on CW.

I am happy to see that the Japanese manaufacturers have reversed the trend of designing and producing ever more expensive radios. I have heard the price with all filters is in the $3,200 bracket, and I think this is the right price. At this price, the FT1000MP will soon replace the FT1000D at my station (also the OT5T contest station). Although YEASU does not see it as the replacement for the FT1000D (which they will continu producing), I am convinced the new FT1000MP will very rapidly replace the Ft1000D and other transceivers in many shacks!

No, this is not a YAESU add, but I cannot find anything wrong with the new radio, except that the CAT instruction set does not match the FT1000D's set. As long as that problem is not resolved, I will HAVE to stick to my old trusty FT1000D, although In wiched I could keep the radio in my shack. But as I know, this radio will probably give me a new one on 160 (Heard), I know it will serve a good purpose...

4397. Tek 604 CRT Display Diagram?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-21 00:00:00 UTC
From: galen@lamar.ColoState.EDU
Message-ID: <48t6m1$10u8@lamar.ColoState.EDU>
Source record: 210032

I have a Tektronics model 603 CRT display unit. It has a little problem with with it's -30 volt supply (it's only -25.6 volts, manual sez -30 exactly) and the manual I have is a poor photocopy, missing some horizontal lines, etc.

Does anyone know where to get a better copy or even a real manual? I only need the diagram marked 'Low Voltage Power Supply/Regulators' and is a schematic of same. The bottom says (I think): "603/604 Rev H June 1976'.

havin' fun,
galen, KF0YJ

>73's
>Nick N3FKS

It's no more expensive than any other hobby!
My brother plays golf, do you know what a set of Ping's cost?

I have 2 2-meter HTs, work perfect $75.00 each.
the 2-meter mobile, 50 watts, $200.00
5 watt 440 HT 150 bucks.
6-meter rig 250 bucks.
HF rig, around 300 bucks new (when purchased) now worth about 150
bucks.

Not everyone has the "top-of-the-line" equipment.
Did you want to talk or show-off?

I would like a new car too, but they cost more than my house did, is
it worth it? I think not!

You only get out of a hobby what you put into it. If you only want to
be a weekend warrior, try paintball!

Gary - KG0ZP

Mike,

Sounds to me that your hard drive is fragmented. In addition, there may be some cross-linked clusters (may help explain the copying from OTHER directory problem you describe).

Try running CHKDSK /F against the drive you question. In most cases, this will be able to repair the problem of cross-linked files.

In article <332B0637@MHS> cowanr@isma8.monmouth.army.mil writes:
>Is there anyone out there who uses the Hal P38 or knows anything about it?
>How does it compare to the PK232 and Kam Plus?

I have one. It won't do all the things a PK232 or Kam will do, but the things it does, it does better than either of them. Of course it does Clover, which neither of the others will do, and it does PACTOR, AMTOR, and RTTY as well. It doesn't do HF packet (no great loss), and it doesn't yet do GTOR (though that's promised as an upgrade), and it doesn't do Morse or VHF packet either. What it does is offer superb weak signal performance on HF. It often offers print on signals the others can't handle, and often on signals you can't hear. With the current crappy band conditions, I find Clover gets through when nothing else in common use can.

HAL has released an API spec so you can integrate the P-38 with other software than what they provide. It's a pretty good and complete API too, so it should be easy to adapt the P-38 to work with other software, for example a Linux driver shouldn't be hard at all. They do not offer internal card programming information so that you could add other modes to the unit, though a bit of careful reverse engineering can get that for you too. The internal DSP software is downloaded from the PC on startup, so you don't have to swap or burn ROMs to change the DSP performance. In principle, adding Morse or packet functionality should be possible.

The card does not use interrupts to communicate with the host, however, and that could pose some limitations on what you can do with it. Your program has to poll the buffer periodically to see if there are characters or status information pending for you. This is to some extent an advantage in the interrupt starved PC architecture, and HF data rates aren't so high that polling imposes much of a penalty, and the on card buffer is large so you don't have to poll often to avoid overruns. The actual protocols are implemented on card, so your application only has to deal with the qualified data streams in and out of the card.

The provided software is generally good. The on-screen tuning indicator is particularly easy to use. There are a few quirks that are irriating, however. The unit really should be able to automatically identify the mode and speed of signals it receives and adapt on the fly. It doesn't, however, and you have to flip flop in and out of the command menus for things like RTTY baud rate and sense, and whether the data is Baudot or ASCII. It also won't automatically switch between PACTOR and AMTOR, but it should be able to do that by analyzing the received signal. Clover operation requires downloading a different software module to the card, but that's not a big deal, the program handles that for you

rather effortlessly when you select Clover operation from the menu. Naturally, the Clover implementation is much more throughly thought out, and works very smoothly.

Clover can really fly too. The qualified data transfer rate can be much better than PACTOR or AMTOR. Clover also allows quasi-full duplex operation. You never need to do an "over" as you do with AMTOR and PACTOR. Data flow direction and control is fully automatic. The protocol adapts moment by moment to channel conditions. Once you make a link, it'll hold onto it tenaciously as long as there's any signal left to work with at all. Your radio does need good frequency stability, however, a 10 Hz tuning error will cause the link to resync. Ideally, your radio should offer 1 Hz tuning steps, and you should make any tuning corrections *very* gradually.

Because of the four overlapping carriers of Clover, which need a fairly phase linear passband, HAL recomends you operate your radio in LSB when doing Clover and let the DSP handle selectivity. But I find that doesn't work so great. Strong signals in the voice passband pump the radio AGC and cause the DSP heartburn. I've found that the Icom FL-100 500 Hz filter works super with the Clover waveform, and keeps most of that off channel trash from bothering the radio (I'm using an IC-706). I can also use the PBT of the IC-735 to achieve a similar effect. The relatively coarse tuning step size of the IC-735 does make tuning a bit touchy, however.

All in all, I like it very much. I'm still working on my own DSP implementation of a QPSK system for HF, but the P-38 sets a benchmark for the current amateur state of the art in HF digital comms. The new German PACTOR II (available in the US from PacComm) also offers a lot of promise, and HAL's other Clover system, the PCI-4000, has more powerful DSP and one higher transfer rate, but both of those systems are much more expensive than the P-38. It is truly the DSP system for the average amateur (at least until we develop something better on one of the cheaper cards, such as those using the Analog Devices chipset).

If you must have HF/VHF packet, or Morse capability, then the P-38 isn't for you. But if you want really good turnkey HF digital capability in Clover, PACTOR, AMTOR, and RTTY, then it's just the ticket. In principle, there's no reason VHF and satellite modems couldn't be implemented on the P-38, but that hasn't been done yet, and given HAL's slant toward HF, probably won't be done by them. AEA has just released a new DSP product that's competitively priced, we'll have to see how that measures up to the P-38.

There are other DSP platforms available for the developer. Notable are the TAPR DSP card, and the various chip manufacturer's evaluation modules, such as the Analog Devices EZLITE product (at $89 a steal). And there are some soundcards with DSP on board that can be used. I've recently found a very good one. It is the IBM M-Audio Capture and Playback Adaptor, IBM p/n-92F3378. This is a card manufactured for IBM by Tecmar which has recently shown up in surplus channels. It has the TMS320C25 on board, and a very good direct dual port memory

and interrupt structure for tightly coupling it to the host. The
included manual offers enough detail to allow you to write your
own DSP applications for the card. A local surplus house was selling
them for $25 (all gone now, don't ask). Check your local outlets
and you may find them there too.

Gary

Folks, I have tried to retieve earlieer articles about the 706 and have no luck. (maybe its the browser) I see that there was a lot of buzz about the 706 but nothing at all about the 900. Looking for observations, please or if you have copies of reviews or opinions I would be interested. I have a couple of reservations about a rig that is dc to daylight (706) but its hard to get info from folks...

tnx in advance//

Hello there

Is there anyone out there selling a 2 meter portable radio. I am looking for A somewhat nice radio. Although I am on a tight budget so if you are selling one fairly cheap that would be nice also.

If possible please e-mail me back on here.

Gregg4111@AOL.COM

Thanks, I appreciate it..

4409. Re: What do you use for 900Mhz Ham?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-21 00:00:00 UTC
From: U40241@uicvm.uic.edu
Message-ID: <95325.222407U40241@uicvm.uic.edu>
Source record: 210044

You might, if you are hamdy, use a 440-450 portable with 900mhz rx ability--e.g., th-78a. Open the tx range to 9xxMhx /2= 45xMhz. Then build or buy, and attach a frequency doubler to the bnc antenna jack between the rig and 900 Mhz antenna. I'm guessing Mini-Circuit Labs has these and if so will sell via phone with plastic money. Check and shield inappropiate radiation at 45x.

Or, take an FT-911, open the cpu limits, tune progressively from 1200 to 900 Mhz. As power drops out, tweak the vco slug to lock in and continue process down to 900. Then adjust ant. tank "coils" and antenna whip for resonance at 900 ham band. Let us know if it works. K9ZAT

ED>From: Eric DeWitt <edewitt@nmia.com>
ED>Look for the line that is labeled Vol/SQ/HI. This should get you good
ED>flat audio from the receiver.

Hi Eric.
Sorry, but the Vol/SQ/HI line in NOT de-emphasized. It is audio from
the discriminator that is amplified to feed the volume and squelch
controls but the audio de-emphasis circuit is if AFTER the volume
control in the audio IC.

But I agree this IS the best place to get receiver audio. You get
anything up to several volts pk-pk audio, enough to drive anything.
Just keep the new circuit above 20k to minimize loading on the pin.

To get your 6 dB per octave de-emphasis all you need is a resistor in
series with the audio and a capacitor to ground after the resistor.
Chose the resistor and capacitor so that [(1/ freq) = (R*C)]
If I want to start my de-emphasis curve at 200 Hz then:
1/200 = .005 = (.1 meg * .05 mfd) = (100k * .05mfd)
To start de-emphasis at 400 Hz another option is:
1/400 = .0025 = (.05 meg * .05 mfd) = (50k * .05 mfd)

I'd use a 100 k resistor in series and a .05 mfd (or .047) capacitor to
ground. If you don't have a .05 capacitor, run the numbers again and
chose a different resistor. You can start the de-emphasis curve
anywhere you want but the lower the frequency you chose, the lower the
final audio voltage will be and you may find you loose too much level.
Note that 100k in series makes this a high impedance circuit. If the
next stage is low impedance maybe 50k and .1 mfd would work better for
you. You can also put the RC network in the feedback loop of an opamp.

For receiver COR, I like the CAS pin. It gives a fast rise time signal,
0 volts squelched and 9 volts unsquelched, that includes CTCSS detect
from the GE tone card. Removing the tone card or pulling the tone
disable line allows carrier only operation.

The original question regarded where to connect a repeater controller
and IDer into a repeater chassis. I didn't respond to that message
because I don't have any direct experiance with those models. On the
transmit side, I just use the normal MIC HI input for TX audio and the
CG HI input to inject CTCSS tone. KF0FX had found that disconnecting
the 200 ohm resistor and 22 mfd capacitor on pin 11 of U101 (the mike
amp IC) removed the mike voltage from the MIC HI input and also improved
the sensitivity and frequency response of the transmitter. On the UHF
exciter boards there may be a jumper (H8 to H9) at pin 11 that can be
cut. On VHF exciter boards I cut and jumpered the trace to open pin 11.

But again, I haven't worked with any repeater models of MASTR II. I would expect an easily available connection for all control signals but I don't have that info. Hope this helped.
73's.

Yes, and the image rejection on the 800-999MHz band is so poor
that you can receive the "blocked" part of the 800MHz band by
tuning the radio to (desired frequency) + 46.1MHz.

: >
: > I'd also like to get a general feeling for what people think about the
: > Standard brand.
: >

I like it's size (not too big, not too small). The DTMF encoder
allows direct entry of digits 0-9,#, and *, but not A,B,C, or D.
You can program these digits into one of six DTMF sequence memories
though.

I've had mine for several months. Works fine, but the tiny
"3-band" antenna supplied doesn't work worth a darn on 2-m.
And 35mW on 1280 is useful for only the most local 1280
repeaters (and as a signal source for testing).

Yes Nick Drake is still in business outside the Columbus Ohio area. I do
not belive they make transmitters anymore. However the old Drake twins
seem to be in plentiful supply. I have the R4/A and R4/C along with the
T4/X and these are versitle rigs. They can run on the WARC bands with as
little effort as adding a crystal to the accessory socket. I run mine on
the WARC Bands with good success. Basically the old 4 line was packaged up
with a white case and sold as an government embassy communications rig.
These old work horses are really great quality and mostly feature point to
point hand wiring. No I do not work for Drake.

From: 2WSK000@gc.maricopa.edu
Message-ID: <01HXVSQTSSEG000RYW@gc.maricopa.edu>
Source record: 210050

Through this net I have recently acquired an Icom IC-3SAT handheld. The set
is missing the UT-49 Touch-Tone (DTMF) code-squelch/paging board, which I
will need to help ham communications with my soon-to-be-licensed wife.

It's OK with me if either your board was purchased and never used, or used
but removed and saved when the set in which it was installed was sold.
If the board works and the price is reasonable, I'm interested.

I will be looking forward to e-mail from any of you who can help.

Thank you.
Steve N7AJP/Phoenix 2WSK000@gc.maricopa.edu

P.S. I have for sale or trade a spare CTCSS (PL-transmit) board (UT-51)
for that same series of small Icom handheld transceivers.

4424. AES DCI 2M Helical Resonator Filters

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-22 00:00:00 UTC
From: daniel@pandora.lugs.po.my
Message-ID: <48u1nq$h14@lantana.singnet.com.sg>
Source record: 209818

Hi,

I understand that AES sells a helical resonator filter for 2M
and was wondering if anyone here has had any experience with it. I would
really appreciate any advise. Thanks.

Meanwhile, I ordered the Tucker TF-144 IMD filter. Well this is
not a cavity type filter as some had informed me. It is in fact quite a
regular 3 pole inductor/capacitor arrangement. The loss through the
filter is pretty high (3-6 dB). However, it does work, perhaps due to the
attenuation. The real problem is not so much with the electrical design
but with the physical design of the filter. It uses a small relay to
switch over from RX to TX bypass. The problem is that this arrangement
presents quite a high SWR to the TX. In fact when the filter arrived there
was a small mistake in the assembly which meant that the filter was
permanently connected to the TX line. This resulted in even worse SWR
and led to the PCB almost melting at 50W. A look at the PCB revealed the
mistake but the SWR, although much lower now, is still fairly high. I must
say I am a little bit disappointed with this filter but at least it *sort
of* works. Yes, the IMD is gone mostly but I could have done that with an
attenuator. Ah, well.... so if anyone can tell me about the AES filter, I'd
be most pleased. Thanks.

Source record: 209824

I would call RF Parts Company. See any QST for their ad / address.
I've bought tubes and RF transsitors from them in the past. Good
prices, reasonably fast service. Free catalog.

HOWEVER... I'd avoid the Chinese-made 572B's. They will NOT work
well in laying-on-their-side service like the SB-200 requires.
The internal structure is weak, and after they heat up well, the
structure -may- sag and cause an internal short... and BOOM!

>I need a pair of 572B's for an old SB-200 amplifier. What is the best
>and cheapest source for these tubes?

I can't speak to levels of quality. But I did call RF Parts' 800-number this week to price 572B tubes. They are offering 3 "grades": Svetlana (Russian) = $140/pair; RF Parts brand = $105/pair; cheap imported (whatever brand is on-hand today) = $86/two, sold as unmatched singles.

BTW, as of this past Monday, all they had in-stock were the cheap ones.

Burt Fisher <k1oik@ccsnet.com> writes:
> Frequently I hear hams say, THE name HERE is_____.
>How often do you say when you meet someone (assuming your name
>is Charlie), THE name HERE is Charlie? You never do that right?

It's a different culture, Burt, and you're experiencing culture shock. Amateur Radio has been around a lot longer than you have, and it has developed its own "code of conduct" and a particular way of speaking. In Mexico, one does not say "My name is ____" -- to do so would be considered an EXTREMELY impersonal statement! One says instead "I am called ____" -- and that's just the way it is.

You seem to be ridiculing a common practice merely because it sounds impersonal to you. From the other point of view, you are attempting to use face-to-face speaking conventions when you are communicating with voice only, and that sounds just as strange to many "oldtimers" as the way it's done now sounds to you.

Remember that for the most part, radio communication is just barely interactive; while you are talking, there is no feedback from your listener(s). Don't expect to be able to use the same conversational style in all situations. For instance, how often do you begin a short monologue with the phrase "Three minutes ago, so-and-so said:" and a direct quotation? How often do you punctuate your sentences with "emotion" indicators? Be flexible. When in Rome, do as the Romans do. Don't flame them lest you be burned yourself. (Oh, sorry. Too late.)

Hey Guy's

You think it is expensive in the States, come down to Australia. I believe we have only 17,000 Amateurs in Australia and more than 50% of them would be retired. Our buying power down here is lousy as we can't seem to get the critical mass to buy in large quantity's.

In NSW, largest population per square kilometer, we have only 3 dedicated HAM shops and these are all one man operations !!. Only ONE carries stock of any decent quantity. There is a LARGE electronics chain that carries YAESU but he is ridiculously expensive !!. He carries a "little"stock. Kenwood, NO stock on the shelves at all !!! ICOM, NO stock on the shelf. Alinco NO stock except for DR70.

Victoria is a little more active but not much more. Our extremely poor exchange rate and hefty import tariffs make amateur radio in OZ a "rich man's hobby". Why bother, connect a phone modem for $199 and go and "surf the net". That's where our future is going !!

Cheers..Peter

I have an E.F.Johnson Courier amplifier (2 811A's) and will be doing
a return to service repair. A visual inspection shows a couple blown
resistors and at least one visibly bad capacitor. It also is missing the
fused line cord. It's obvious how to proceed, but I wonder if anyone
in this group has experience with one and can tell me how it performs
in SSB service. Also, any tips on mounting fuses on the chasis and
whether it is wise to replace the old tube rectifiers with a solid
state supply? At this point it is merely an interesting project.

Source record: 209841
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

I have a Systron-Donner model 8155 "Synchronized Timecode Generator" that needs some work. I'm trying to find a manual for it.

I called an old number for S-D, but it's disconnected. I tried Manuals Plus, but Jack didn't have anything. Before I call Tucker (who usually get $50 a pop for manuals), anyone know of any other sources for a manual for this thing?

Short of a manual, info about this unit from anyone who's familiar with it would be appreciated. What does it synchronize to? (If I can get it working, I'll be driving it with a rubidium freq standard, and using GPS to get the second tick lined up.)

Thanks...

Yes some equipment is expensive. Most of the new stuff is.

I remember when if you didn't build at least some of your own equipment
you were an appliance operator. Now we all (pretty much) are. We dial
800 numbers and order.

There's lots of used equipment out there. Some of it works just as well
as the day it was purchased.

I have known people who had a challenge to attend a hamfest, buy enough
equipment to put it on the air for the least amount of money. This was
usually less than $100. Then actually put it on the air. Then donate
the stuff to someone who couldn't afford to buy anything.

A thread similar to this appeared in the .homebrew group earlier this year.
The basis of that one was the cost/performance of Ramsey's 2M kit but the
general conclusion was either buy used or convert land mobile equipment (there
is a project going on now to gather peoples experiences in converting this
equipment). I plan to do the latter.

<snip>
a source that might have a cw filter for a ts-520s for sale.
<snip>

Try IRCI (International Radio and Computers Inc) in Florida.
Don't have their address/phone handy, but they have ads in
most amateur radio publications. Been around for years and
seem to be reputable. They bought out Fox-Tango a few years
ago when F-T's owners wanted to retire, and they still offer
F-T filters. I bought an F-T filter back in the early '80s
for a TS-520S and it worked g-r-e-a-t! Try them.

>
>Thanks,
>Kory
>KE6VWO
>
Here's my two cents worth Kory. I have run verticals since I got my license back in '71 and they are not as bad as everyone would have you believe. (You know the old joke: a vertical is an antenna that radiates equally poorly in all directions.) I, and a lot of other hams have had good luck with verticals. Properly installed they can have low angle of radiation which is good for DX. Mulitband verticals have the advantage of several bands on one coax. And no kidding, I have worked DX stations that some of my buddies didn't because I didn't have to adjust a rotor for a beam. (On the other hand they have beat me out of quite a few more.)The real question for anyone who is gonna use a vertical is: can you really get a lot of radials out? If you look at the ARRL antenna book and others you see that for a ground mounted vertical to be reasonably effecient you have to put out a BUNCH of radials. I'm talking like 120 of them. Less radials and the effeciency of the antenna drops considerably.
You have other options. One is mount the vertical up off the ground. This is what I did when I lived in North Dakota. I had a 14 AVQ up on the roof with about three or four radials
per band and it worked very well. Ran a lot of QRP with it.
You can also mount shorter verticals i.e. 10-20 meters as vertical dipoles. Especially on ten meters this is very do-able. Just build a 10 meter dipole out of some kind of metal and stand it on it's side.
If you don't want to put out a gazillion radials for efficiency get a vertical with an elevated feed point. This is where antennas like the GAP make sense. With a GAP and 3 watts I worked a UA on twenty meters just a couple of years ago, after the solar peak. But they aren't perfect either. On 80 mine is pretty poor.
Anyway go out and experiment with your vertical ideas. I always like to have one as a back up to whatever else I am using. Good luck.

4464. Pioneer KE-A530 question

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-23 00:00:00 UTC
From: candea@ATHENA.MIT.EDU
Message-ID: <492p7f$3dd@senator-bedfellow.MIT.EDU>
Source record: 209908
Cross-posted to: rec.radio.amateur.misc,rec.radio.cb,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,alt.radio.uk,aus.radio.amateur.misc

I apologize if I am posting this to the wrong newsgroup but I am in desperate need of advice. I have a Pioneer KE-A530 car radio + cassette that my friend removed from his car a while ago. I am not sure which wires go where because I don't have the manual anymore and there is no indication on the radio as to what each wire is. I would appreciate if any of you could tell how to make the connections (i.e. which is PWR, GND, speakers, etc.).

The wires are in three "bunches":

Bunch 1: blue
black

Bunch 2: green/black (2 wires)
gray/black (2 wires)

Bunch 3: black (this is definitely a GND -- connected to case)
red (has a 0.5 Amp fuse on it and a little box)
yellow
orange (this must be PWR -- it has a 0.5 Amp fuse)

I really appreciate your help. I reply to my personal e-mail address, as I do not read this newsgroup regularly.

Thank you,

4468. Re: Kenwood HT79 Mods/Info

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-23 00:00:00 UTC
From: "Finskas Erik Matti Wilhelm (csb1_95)" <finskase@ee.port.ac.uk>
Message-ID: <49212h$aag@hawk.ee.port.ac.uk>
Source record: 209912

There is a modification booklet available from Kenwood dealers, which have all possible modification instructions available for the radio. The 800MHz modification is possible only if there are components for the 800MHz front-end! The TH79A (American) model does not have the components installed because it is illegal to monitor 800MHz band in US (This is information I received from Kenwood)

The radio can operate as cross-band repeater, it can clone its memories to another TH79, the radio can remote control a Kenwood mobile radio, wide RX and wide TX.

The easiest modification to the radio is to cut the GREEN WIRE which you will see if you take off the CTCSS unit cover (Side of the radio) This will enable wide RX & TX.

I had just narrowed my choice of antennas down to a butternut or hygain vertical, when I saw the add for GAP. They make some very bold claims in there adds. I was wondering if anyone can share there experiences with the GAPs, specially compared to the butternut hf6v or the hygain dx88. I've never seens a decent vertical without radials. Both the hygain and the butternut have radials. I'm most interested in the 20,40,80 meters for DXing and 10 meters for local nets. I'm looking at the GAP TitanDX.

Thanks,
Kory

My two cents worth.....

You can bet that ANY and all no-radial verticals will not work as well as systems with even a modest radial system.

Keep that in mind, the "no free lunch" tale really applies well to this one.

4476. Advice needed, amtor on Icom 725

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-23 00:00:00 UTC
From: Stan Honey <shoney@delphi.com>
Message-ID: <x3JGbka.shoney@delphi.com>
Source record: 209920

I have a Icom 725 that I want to use with a KAM Plus for digital modes. I am considering getting a FL100 500 Hz cw filter for the IC725. The IC725 does not have IF shift/passband tuning. So my question is: will this combination work for digital modes? I assume that the center frequency of the audio output of the IC725 will be around 800 Hz in NBCW mode, based on my interpretation of the service manual. Is this correct? Can the KAM Plus be adjusted to work with audio tones that are that low compared to the 2210 Hz center frequency that the KAM Plus normally uses? Do I have to either live with the 2.3 kHz SSB bandwidth of the IC 725 or buy another radio? I've considered getting one of the fancy audio filters instead, but a strong adjacent signal that fit into the 2.3kHz IF bandwidth would still cause the IC725's AGC to desensitize the IC725 to the desired signal.

Thanks in advance for any advice.

Just saw an ad in the December '95 CQ magazine for a new vertical from
Hy-Gain that is 10 - 40 meters, stands 29 feet tall, is self supporting,
and requires no radials. They also make the claim of 750 watts key down
for 30 minutes and no problems. They don't mention price but I assume it
is competitive.

I ran a Cushcraft R-5 and I was extremely impressed with how well it
worked.

Aside from being a processed nuclear survival food, spam has its own endearing definition as it related to the Internet.

"Spamming" is when a message is posted to serveral, even all, newsgroups at once. Prime examples of spamming occur when some goober posts a "Make 20 Zillion Dollars by Picking Your Nose" post to every single newsgroup in existence. Then, in each of those newsgroups 50 people post a response saying "I picked my nose and only made $.73 you &***#$%!!!!". Most usenet programs will then post that reply to every group the original post appeared in.

I notice that I am posting this response to all the rec.radio.xxx groups. Since I don't know where this thread originated, I'll leave it that way....and now I too have become a "spammer"!!!

Hope it is now clear as mud!

Wow Alan! As a former subsciber of Ham-L, and primarilly a lurker to
the rec.radio.xxx groups, I've never seen anybody with such a
well-written rebuttal for one of Burt's tired old questions.

I hope someday Burt will stop asking the same old questions, and maybe
even get out of the hobby he so dearly hates.

4484. Receiver problem Icom 737

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-23 00:00:00 UTC
From: ko6ec@cris.com
Message-ID: <ko6ec-2311952051300001@192.0.2.23>
Source record: 209928

I have a 2 year old Icom 737 that has developed an odd problem. The receiver now needs time to "warm up." Example: I power up the radio and get only silence from 14.000 to about 14.080. Gradually, over the next few minutes, this silence covers less and less. After about 10 minutes, I can listen to the whole band. The same appears true in other bands (for example 28 Mhz, 21 Mhz and 7 Mhz). The portion of the band effected is the same on all bands. That is, if I hear silence from 14.000 to 14.055, at that same time I get silence from 21.000 to 21.055. Any thoughts? How serious? One person told me to get a service manual and make a minor PLL adjustment. Thanks for the help.

Frank, KO6EC

4485. RS HTX-212 = MTX-146?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-23 00:00:00 UTC
From: satoshi@maui.net
Message-ID: <491nj6$dm4@makai.maui.net>
Source record: 209929

Hi everyone,

I took off the cover to my Radio Shack HTX-212 and noticed that
the board calls itself MTX-146. Also noticed (c) 1994, when
this model is new for 4Q '95.

Does this mean another label sells the same unit as MTX-146?
(Looks similar to Kenwood TM-241, but a few differences.)

Does anyone know who? Are mods avail?

4486. IF filters vs DSP for CW

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-23 00:00:00 UTC
From: johns516@maroon.tc.umn.edu
Message-ID: <johns516.62.00431A02@maroon.tc.umn.edu>
Source record: 209930

I just bought a Kenwood TS-930 and am thinking about getting the internal IF filters for CW work. (I would probably get both 500 Hz filters.) However, I am also looking at the specs for the DSP units that are available externally. It appears that both approaches have the same goal, increased selectivity and removal of noise.

How do these two approaches compare for increased selectivity? For removing QRM? I assume the DSP units are are better at removing QRN. True? What am I missing.

Any comparisons would be appreciated.

73, and thanks.

It's always interesting how two people can look at the same thing and see it entirely differently.

I have thought for a long time that ham equipment was surprisingly low-priced. Have you opened up a state-of-the-art rig lately? The amount of engineering and assembly labor in there is astonishing, in my opinion. About one month's pay for most of us would buy an excellent rig. There's no way any of us could BUILD an equivalent rig with one month's effort, is there?

And if one really wants to hold down the cash flow, a used rig can be an excellent buy. Lots of older rigs are available for $400-$1000 that will do virtually everything you'll ever want. Spend your time instead of money by investigating what's for sale and you'll come out way ahead.

Since you mentioned HF mobile specifically, check out an older ICOM IC-730. I've used one mobile for years (both auto and boat) and it's hard to beat for small size, ruggedness and convenience. I see them advertised quite often for $400-$425. Even our younger hams can afford that. 40 lawns mowed at ten

bucks a pop and there you are! And the beautiful part is that when you go to sell the '730 or whatever, you'll get nearly your full price back for it. It will have cost you almost nothing at all.

Now what was that again about ham radio being so expensive....??

>also any other info about the 850 that I might need to know
>thanks Don

I have the same setup. Just follow the factory instructions. It worked perfectly the first time. When I added a 250 Hz filter to the Kenwood I did do some tweaking of the KAM's settings for mark and space to get them exactly aligned with the '850. If you need to do that, and if you're running Hostmaster II software, be sure to set the default shift to MODEM rather than a number. Otherwise you'll lose your changes every time you exit the RTTY mode. Right now before you have the rig in hand you're probably wondering what all that means, but after a bit of playing with it, it'll come clear.

Email me if you have more questions. An '850 and a KAM are a great combination...have fun!

>mostly interested in DXing with SSB and CW.

Check out the included filters, etc. on the FT-1000 (non-D) vs. the FT-1000MP.
You will find the cost of the original FT-1000 goes up significantly if you start
adding necessities like the CW filter in the sub-receiver, and accessory filters
in the main receiver. I'm not sure, but I believe the MP includes those filters
"stock." If so, the MP is the better buy (and you won't miss the extra 100
watts).

The spec is available from the RTCM. I am not sure what you are looking
for when you say a generic receiver? I have been finding that if the DGPS
receiver outputs RTCM104 it will work with any GPS that has a RTCM
port.

>communications recievers with low audio power output, you want a very
>efficient speaker with a small magnet.

That's absolutely correct. Large magnet structures are only required when it is desired to achieve the torque necessary to move large amounts of air. To maintain a given SPL, air movement must increase as the frequency decreases. Increased torque also means increased power consumption, so the voice coil structure of such speakers is also much heavier. Thus, they will be less efficient as the frequency increases, due to (at the very least) inertia of the mass. The low frequency response that accompanies such speakers isn't required in communications, so there's no reason to use such an inefficient design.

The lack of required bass response is also the reason communications speaker enclosures aren't usually sealed. Wavelengths at 300 Hz are much shorter than 30 Hz, so the face and sides of the enclosure are sufficient to prevent any front/rear cancellation that might otherwise take place. As with the motor structure, sealing the enclosure in order to extend the low frequency response sacrifices efficiency.

The bottom line is that audiophile speakers will generally perform poorly for communications work. Save your money for something useful.

->
-> Where is it available? How much does it cost??
->
-> Any favorites being used??
```

Hi Darryl...

Noticed your query and I felt compelled to give you a response.

I may be slightly biased, however, and it is not even finished yet, but I want to make you aware of Cat Control Center, a.k.a. CATCC.

It is windows based, it provides full control of our radio and peripheral equipments over RS-232 and printer ports, full DX-Cluster interfacing with sound blaster voice announcements and programmable alarms and a whole lot more.

You can obtain an demo version from my BBS at 1-908-363-2760 or the ARRL BBS or various ftp sites, such as demon.co.uk for one. The files that you want are CATJR1D1.ZIP through CATJR1D4.ZIP, be prepared though, as zipped we are talking almost 4MB of files.

The demo program only supports Yaesu and Kenmwood radios, many of the features have been reduced in scope and or range or completely removed. The demo does provide a very good idea of what the full version of the program will be light. Logging in the demo is to a simple CT .RES ascii file which you can import to your present logging program (if so supported) however the full version of CATCC provides a full logging and award tracking capability written in Visual dBASE, CATCC itself is mainly written in Visual Basic.

/s/ Steve, N2CKH

Really? From purely RF point of view, TS-930 is much better than
TS-940. Many contesters still prefer 930 to 940. Some including myself
avoid 940 because it is noisier under strong near-by signals.

4499. 706: My Tx & Rx results

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-24 00:00:00 UTC
From: ab910@lafn.org
Message-ID: <1995Nov24.035841.1519@lafn.org>
Source record: 209855

Hi all.

I've seen a few false statements on the Icom 706 posted here lately.
I did a few tests myself and here are the results.

The unit will transmit within the HF and 6M ham bands only right out of
the box.

With the SMD diode mod' the 706 will:

Receive: .03Mhz-200Mhz (Just as stock)

Transmit: 1.6Mhz-54Mhz (All modes except FM wide)
118Mhz-174Mhz (All modes except FM wide)

And that's all.

No FM or AM broadcast band transmit. CB band is a go. (A $1300. CB!!!)
Cordless phones and baby monitors are a go. (Why bother?)
VHF/high band receive is okay only with the yellow wire mod. Without that
mod' the radio's deaf above 2M.

And that's all there is to it. There are no other mod's (yet) to
transmit anyplace else. Period. Don't even ask me. I don't know.
The two mod's that have been posted here lately are it. If you want 'em
do a search of recent posts on this item. They're very simple mod's.
(Crush a small diode with forceps and pull out one yellow wire from a
bundle.) I will not give them out myself. I was the first one to put out
the diode mod. I got it faxed from Icom. I've seen no others.

Buy it as a small HF mobile and you won't be disapointed. I like mine.

As a newcomer to the tech area I wish I lived a lot closer to you. We have
a builder group on Monday nights but they seem to be more on the hi tech end.
Way above my head. I'm technically challenged (must be p c you know) but I
would find it great to do something like you are running. I built 2 different
antennas for my HF, cosmetically not the best but they work for me. As for
throwing things out, HORRORS! I find some real treasures in the discards of
```

others. Even some non-working things I've been able to examine. I've been looking around for some simple plans to build an antenna tuner, capable to handle of 150w. I get a lot of, "look at hamfest/flea markets, buy used one reasonable price." I know that, I want to TRY to build my own. Just like after passing my 5wpm test, I did it on my OWN. I want to try to build some HF gear on my OWN. Oh, I've gotten a lot of local area help on various things, but I hate to impose, they have lives of their own. Oh well, <sigh>.

4505. IC706 one cycle tuning

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-24 00:00:00 UTC
From: n4lq@iglou.iglou.com
Message-ID: <DIK19z.H7J@iglou.com>
Source record: 209861

Anytime I activate the 1 cycle tuning, the display always reads 0.
This tells me that my readout is not really showing the exact frequency
down to the last cycle rather, it gives me an uncalibrated reference
point much like a logging scale. Has anyone else noticed this?

>I do not read this newsgroup regularly.
>
>Thank you,
>

I'll try, but dont blame me if it blows up!!!. Ok...start with bunch 3. The black wire goes to battery negative terminal, or chassis ground. The red wire with fuse holder and box (noise filter, likely) goes to ignition ACC ON. T The yellow wire is used if you want to send a signal to an auto amplifier (external power amp, subwoofer, etc) or a power up/down automatic retractable antenna. The orange wire might be to control a clock if the radio has a clock built in. Orange wire would then go to the battery and the red wire would go to the acc side of the ignition switch. Then, when you turn the car -on-, the radio works. Otherwise, when the car is off, the only power received by the stereo is on the orange wire and the only operating function is the clock. Only when the car is -on- does the radio/tape actually work.

bunch 1 : blue/black...bunch 1. not sure, possibly line in for an equalizer.

Bunch 2: most likely, this is left channel positive and negative (to speaker left)
most likely, this is right channel positive and negative (speaker right)

Without trying it, it's hard to say. Does the radio have a "fader" for
front-and-back speakers, or is it only a 2 channel output (left and right but no
front and back)???

Keep your posts here...someone can probably help ya.

What am
>I missing.

IF filters will offer selectivity before the signal is demodulated to audio. External DSP filters add selectivity to that audio. Selectivity helps eliminate the problems caused by strong adjacent signals to the frequency you are listening to. Without IF filters, the strong signal will reduce the sensitivity of your receiver. I recommend both as the DSP filter will add to the selectivity provided by the IF filters, help reduce noise and help eliminate heterodynes when you're operating SSB. If I could only have one, I'd choose the IF filter. 73, John

Not really. You have posted 'velveeta' (Vegetarian spam).

The difference is that velveeta is crossposted (note the newsgroup line). On the internet, this message will cross the backbone once, and be stored on the ISP host harddrives once, with references to the crossposted newsgroups. It can't even really be called velveeta because you were answering a valid question, even if it was off-topic for the newsgroup in question.

Spam is a message, usually commercial in nature, that is posted once for every newsgroup. In this case, the same message will cross the backbone and be stored on the harddrive once for each newsgroup, resulting in massive waste of bandwidth and disk space.

Internet lore: the term was derived from the Monty Python skit, were 'spam' was said/sung numerous times. It was a really funny skit, too.

Hope this helps.

Everything worked OK. The RX is no much wider than before!
Does anybody know what function the red wire loop which is closed to
the blue wire loop has? Maybe it will enlarge the TX?

Any experiences, any suggestions?

4516. PRODUCT REVIEW: PALOMAR ENGINEERS' TUNER TUNER

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-24 00:00:00 UTC
From: mc@shore.net
Message-ID: <495b8o$at6@northshore.shore.net>
Source record: 209949
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

PRODUCT REVIEW: PALOMAR ENGINEERS' TUNER TUNER

The Tuner Tuner does just that - allows you to adjust your antenna coupler to a given frequency without using your transmitter. This is particularly important for those using solid-state finals that are not particularly forgiving if they don't see close to 50 Ohm impedance. Not to mention cuttingdown on the QRM!

The Tuner Tuner is easy to install - simply put it in line between your transciever and antenna transmatch. Install a 9V battery and you re done. To use, tune your receiver to the desired frequency, and switch the Tuner Tuner to TUNE. Adjust your antenna tuner for a null in the noise from the receiver and your antenna is tuned to match the transmitter on that frequency. Make sure to turn the Tuner Tuner OFF (or you'll risk putting R F into it). Its that simple! If you do forget to turn the Tuner Tuner off you will blow the internal fuse (and a spare is provided!) but otherwise the instrument will be unharmed.

When I first saw this accessory in the Palomar catalog I wondered why anyone would want one. I thought I could use the Palomar R-X Noise Bridge to accomplish the same task, ie: preset my antenna matching unit to different bands and frequencies and note the settings for future reference. What I hadn't taken into account is the fact that the antenna impedance would vary at a given frequency under different conditions, like ice. The tuner tuner was designed to be left in line and switched on as needed.

The Tuner Tuner is well constructed of quality materials and is a worthwhile adjunct to any antenna tuner system.

Snip

Try powereing the Kam from a different PS than the '850 , there is an
occasional problem with the xmit audio being distorted when the Kam
and TNC are powered by the same source.
I used different supplies and never had a problem.
You'll love the quiet t/r switching of the '850

Only mod I've ever heard of: Paint it a different color.

John
KE6TGN

What function keys do you push to change the color ??? :-)

There is a small circuit change for 9600 Baud packet.

We need a few new word for the three types of mods.

1. Function Key changes to the CPU
2. Cutting jumpers to enable a new option
3. Re-wiring and circuit changes.

Nick Feliccia (feliccia@unix3.netaxs.com) wrote:

: Has anyone notice how DAMN expensive ham equipment is.

** SNIP **

Not really. I have been a homebrewer since high school (1969), when my budget was such that a TV set by the side of the road was considered a gold mine. Made a lot of nice equipment from that burned-out junk. At that time, I drooled over the Heathkit catalofues with their SB-series equipment. By way of unleashed scrounging, I now have a fairly complete SB station. But, I still homebrew.

** SNIP **

: What can we as hams do nowadays about this? Do we turn to Homebrewing. I am
: an EE and I know what it takes to build something. If you have a nice variety
: of parts, etching facilities, a 20 MHz scope at least, in short a working
: electronics lab you can do it. Otherwiese I feel making anything but a
: groundplane is more trouble than it is worth.

** SNIP **

Ah, yes: It's soapbox time. Here it is:

As they say, EE heal thyself. Any engineer, in any discipline, who feels that rolling up his (her) sleeves is not worth the effort, should get out of the profession and make more room for people with genuine engineering talent. Flame me if you will, but an engineer who does not enjoy his profession is about as useful as a sex partner who does not participate. And by that I mean that they are without any value whatsoever.
Heathkit did not die as a direct result of the lower cost of Japanese "appliances." It died because our society stresses convenience and instant gratification, and places little or no (often negative) value on hands-on labour and personal accomplishment.
In a very disturbing article in Design News some years ago (I still have the clipping somewhere), it was revealed that Stanford University has a first year engineering course which I have named "Tinkering 101." In this course, students are given such things as bicycles, etc., to dismantle and then reassemble, the goal being to interest the students in the art of "tinkering." It is my opinion that this should be part of the entrance exam for engineering.
I've met engineers who turn white as a sheet when they get near the machine shop door, including one mechanical engineer who didn't know the first thing about a vertical mill. The shop supervisor forbid him entry.
Is it any wonder to those of us who like getting dirty that the best engineers often don't have degrees? They learned the hard way, be-

cause they enjoy it.
So, if you are a degreed EE, and a ham as well, then you have no reason to not being a homebrewer. You should, in fact, be out there providing the technical leadership that this art (not hobby) needs. You don't need the latest and greatest test equipment. Your project doesn't have to have all of the features of Kenwood or Yaesu. It just has to work well enough to get you on the air.

Okay. Take your best shot. Aim well: I don't die easy.

Chris

4523. Source for Tower?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-25 00:00:00 UTC
From: grscott@nc5.infi.net
Message-ID: <4964v9$kda@news.infi.net>
Source record: 209867
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.antenna

I am not an amateur radio operator, but I do want to erect a tower (currently only for an anemometer, but perhaps ultimately for a wind generator if the wind measurement provides sufficient justification) somewhere between 80 and 120 feet high.

Since I can weld and have hydraulics available, I may just buy some long H-beams and build my own fold-over tower; however, if I can find a good source for a more conventional triangular tower, I might go that way. Anybody got any recommendations they'd care to share?

Thanks!

If you're only going to work CW and possibly RTTY, the 250 Hz filter is the best choice. If you might want to work AMTOR or PACTOR someday, the 500 Hz would be the one. Those modes need slightly more than 250 Hz.

Hi Craig,

The closer to the antenna, the better the filter or noise reducer works!

Re selectivity, audio DSP's improve copy a large amount. But the best
choice (if you operate a lot of CW ion crowded bands) is an IF filter. If
you depend only on a DSP, strong close in signals will reduce the audio
level of the signal you want to hear. They can also won't stop beat notes
from late IF, detector, or receiver audio overloading that may cover up
the desired signal even with a highly selective audio filter.

The same goes for noise reduction. By the time the noise makes it through
the receiver, it "appears" very similar to the desired signal in waveform.
An audio DSP has a very difficult time removing noise at that point.

DSP's are worthwhile, but can't make up for all receiver shortfalls.

Hi Craig! I'll second Tom's statement. I've tried (and have) both
filters. An IF filter will surpass the performance of the DSP in the
selectivity department. DSP is nice for noise reduction and automatic
notch action, but I've found good IF filters to be much better for
improving selectivity than DSP.

Just my $.02 :-)

Just a quick note on noise-generating matching devices..while they work well I have found them to be useless on an active band. The noise level is often well below the ambient signals and noise, so you can't hear well enough to find the null. It works well on a quiet band, but don't expect it to be too helpful i n the midst of working a rare on.

4538. Re: Radio with Taping at Selected Times?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-25 00:00:00 UTC
From: wayne@netcom.com
Message-ID: <wayneDILtuD.DsF@netcom.com>
Source record: 209882

With respect to my original posting, I've had a couple of
responses that get me close to an ideal. There are at least two
receivers: Sony SW-55 for about $350 with output to a separate
recorder, and a Sangean, sorry I don't have the number available, with
a built in recorder for about $200.
I wonder if it might be possible to modify a VCR to something
along the lines I originally described? That is, use the timer to
turn on an AM/FM radio that has a tape recorder, and removed
any connection to the VCR's recorder. Of course, the
radio would be set for only one station.
My current solution was to buy a cheap AM/FM radio with
recorder, and a Radio Shack digital appliance timer.

>
>The same goes for noise reduction. By the time the noise makes it through
>the receiver, it "appears" very similar to the desired signal in waveform.
>An audio DSP has a very difficult time removing noise at that point.

This latter point is a catch-22 situation. The reason noise looks
"signal-like" at the detector is because of the sharp filtering in
the receiver IF, which shapes the power spectral bandwidth of the noise
to resemble that of the desired signal. If you don't run sharp filters
in the IF, the DSP will have an easier time distinguishing signal from
noise, and will do a better job "denoising" the signal. But of course
you have all the other problems Tom mentions when you do that.

So, if there are undesired strong signals in the passband, the best
way to deal with them is with an IF filter. But if the problem is
mostly noise, a wider receiver IF filter and a DSP will work better.
In either event, however, the DSP will sharpen the skirts of any
IF filtering which is present, and that's generally beneficial.

Perhaps the most benefit from the denoising capability of the
current generation DSPs is derived by a DC receiver. Since it
has no IF filters, it doesn't shape the noise spectrum to resemble
signal, and the DSP can much more easily remove the noise. Also,
since the DC receiver has only a mixer (and perhaps one RF stage)
before the DSP, it is less subject to some of the ills that a
superhet suffers with nearby signals pumping or overloading the
RF and IF stages, IE you can't have AGC pumping if you have no
AGC, or if your AGC is audio derived and thus *includes* the
DSP filter in the loop. In the latter case, you're no worse off
than if you were using a superhet with a narrow IF filter as
far as AGC pumping is concerned.

The only real drawbacks to DC receivers with DSP is that conventional
DC receivers have no image rejection, and inexpensive DSP units have
only a modest dynamic range. The former problem can be attacked via
phasing, as in the R2 receiver. The latter can be mitigated by use

of audio derived AGC to control the receiver RF stage gain (or the attenuation of a PIN diode in the front end). The latter is probably preferred for most HF operation.

>Am Considering buying the JPS ANC-4 Antenna Noise Cancller. Does anybody
>have any experience or comments on this unit?

Yes, I picked one up today, to see if it would remove computer noise on my hf rig. Worked as advertised, I had a s3 noise signal coming from my computer monitor, on the freq I was tuned to and was able to completely remove it. I had tried a number of thing to rid myself of computer hash and I was impressed on how well this worked. Only complaint, is it takes a bit of playing with, before you get a feel for how it works.

Yeah, consult a *competent* structural engineer. With that long a
moment arm, wind loads become significant for even modest frontal
areas. The Rohn tower catalog has a good deal of information on
this, but if you're building your own tower you'll need competent
analysis to determine its wind survival rating with various wind
load areas on top. Don't expect to put up a big wind generator, IE
anything with a swept area larger than about 10 square feet, without
doing some serious structural engineering.

>watts).
>
W e l l ....
I just bought the 1000MP, and the "stock" transceiver does not come with 500
or 250 Hz filters in either 8.215Mhz or 455Khz IFs. I bought the 500Hz filters
for 8.215Mhz and 455Khz IFs, list($179 each).

The _major_ diference with the 1000MP is the new "EDSP", (enhanced digital
signal processing". Built-in noise filters, auto tracking notch, etc. The rig
has so many features I could fill several pages and not cover them all. In
all, I love the 1000MP, it's truly a dream on CW!.

I should add though, I find quite a bit (S9) of AM broadcast intermod from
about 2.0 - 3.6Mhz. With all the switchable filters in the front end, I would
not have expected this. I should add that I live about 5 miles from NYC, and
am close to many local AM broadcasters, but never noticed this problem with my
Yaesu FT-890.

Hope this helps more than confusses...

In a local ' junque ' shop which carries some military surplus gadgets, I've found what appears to be a UHF power amp. Apparently modern military surplus. It's a 19" rack mount rig, about 7" wide and 3" thick. Takes 28v DC for power. Has two female 'N' type coax connectors, one in and one out. No markings as to frequency or even band. I'm assuming UHF. Manufactured by 'TPI Comm Inc.', according to sticker on unit and box, however no address or telephone number. Any idea what this is, and/or how to contact TPI Comm for more info? Thanks all. Rick Crider KD4FXA Monroe NC

4566. Need Help: Repeater Amp and Pre-amp.

We (our radio club) are considering adding a receive pre-amp and a power amp to our 2 meter repeater. I'm confused about the duplexer cavities and their placement. Should the receive pre-amp go between the antenna and the duplexers or between the duplexers and the repeater itself. Also, for the power amp, should the power amp go between the repeater output and the duplexer input or between the duplexer output and the antenna. Any help on this is appreciated. Don't want to fry anything. :-)

>when it is desired to achieve the torque necessary to move large amounts
>of air.

Not necessarily, but I am not going to talk to magnet size, instead
I will use gauss, or magnetic field strength. A high guass speaker,
if designed for high frequency reproduction will be more sensitive than
one with a low gauss rating. Or, will be more efficient.

It's power limitations will be both a
combination of the coil structure and the mechanical limits the
cone can move. For communications receivers, the audio output rarely
exceeds 5 watts, therefore, it is easy to find a speaker that will handle
the power electrically. Then the main concern becomes mechanical capability.

>To maintain a given SPL, air movement must increase as the
>frequency decreases. Increased torque also means increased power
>consumption, so the voice coil structure of such speakers is also much
>heavier. Thus, they will be less efficient as the frequency increases,
>due to (at the very least) inertia of the mass. The low frequency
>response that accompanies such speakers isn't required in communications,
>so there's no reason to use such an inefficient design.

Mostly this assumes the use of a large speaker, but it is true, a large
speaker will poorly handle the highs needed in communications work. The
voice coil will be unable to change the direction of the cone mass quickly
resulting in not only loss of efficiency, but distortion due to "cone
break-up."
>
>The lack of required bass response is also the reason communications
>speaker enclosures aren't usually sealed. Wavelengths at 300 Hz are
>much shorter than 30 Hz, so the face and sides of the enclosure are

>order to extend the low frequency response sacrifices efficiency.

Indeed, there is no need to seal the enclosure, but if you have one, just
make sure that the volume of air inside is way above the critical amount
for that speaker. (Vab)

>
>The bottom line is that audiophile speakers will generally perform
>poorly for communications work. Save your money for something useful.

Absolutely! I personally use an 8 inch PA horn for listening to voice
communications. Otherwise, I use the 5 inch communications speakers
from the professional two-way manufacturers, but they rank a distant
second to the horn in my opinion.

Yes, they have the same goal, however...
>
>How do these two approaches compare for increased selectivity? For removing
>QRM? I assume the DSP units are are better at removing QRN. True? What am
>I missing.

Since the IF filters are part of the receiver design, they are inherently
going to work better. By filtering out the undesired signals before amplification,
the circuits have a much better chance of staying linear. Also, the AGC action
is dependant on the total signal it is fed to it. The circuitry then makes a
determination as to how much gain should be eliminated to maintain linearity.

The DSP units are mathmatical monsters. The incoming analog signal is sampled and
converted into a digital representation. Noise reduction is achieved by nifty
algorithims which basically recognize voice as being more coherent than noise.
Same thing with the auto-notch, this time in reverse. A carrier, which produces
a hetrodyne in an SSB receiver, is far more coherant than a voice signal.

The notch, as well as frequency response are handled through a mathematical concept
known as convolution. It is a fancy way of saying you're algebraically summing
together the undesired signal with it's inverse. Since everything exists in a
numerically domain, it is (almost) as simple as 1+(-1)=0 and *poof* no more
undesired signal.
>
>Any comparisons would be appreciated.

The bottom line is to start out with the best possible receiver before adding the
DSP unit. The better the receiver, the better the DSP performance will be.
>
>73, and thanks.
>
>Craig, AA0ZZ (nifty new call, huh?)

Pretty neat call. The best one I have found so far though is VE4VV (especially during a
cw contest, toward the end, when you're getting punchy!)

The receive preamp should go between the repeater receiver and the
duplexers. Remember, the transmitter and receiver run at the same time on
a repeater, so the preamp would need to be out of the tx path at all
times. You don't need to buy a re preamp with antenna switching, since it
will be full time receive. Also, I have several of the rx preamps
advertised in the ham mags that are made by ARR and would recommend them
hands down for repeater applications. I've tried many others, but have
the best service with the ARR units.

>Also, for the power amp, should the power amp go between the repeater
>output and the duplexer input or between the duplexer output and the

THe TX amp should go between the repeater transmitter and duplexers.
Again, the rx and tx run at the same time and the PA would need to be out
of the rx path. What type of amp are you considering? Don't bother with
conventional ham amps unless they are designed for repeater operation.
Most amateur fixed station/mobile amps are designed for low duty cycles.
Their heat sinks and internal components are inadequate for the high duty
cyles that ham repeaters demand.

Which is precisely why I hammered at getting the feed and antenna length
exactly correct, they are critical in antenna system's performance.
There will be some distortion anyway since 1/2 of the stub exists
in only one point about the anenna. As I previously mentiond, it
would be an improvement to have in completely encircle the anenna, but
again, it isn't practical for the small amount of improvement achieved.
>
>Your real world results seem to agree with my understanding of how the
>antenna behaves, and Moritz's theoretical explaination was also not wrong.
>
>73 Tom

Tom,

Obviously, we aren't going to converge on this. Theory doesn't converge
nicely either. In my opinion, this
antenna will not work better with a balun if properly manufactured and
adjusted. Actually, it should deteriorate in performance.

In this antenna, the current balun would ruin it as it would try and force
the currents to be in phase on the stub which would result in
the stub radiating, which is what we are trying to avoid. Unless
you were actually referring to an un-un.(I hate that term!)

The quarter wave stub acts as both the decoupling mechanism and matching device,
at least from what I can gather from available materials and a friend who
works on antenna design.

I personally belive that at VHF and UHF, the construction of most baluns
are beyond the average amateurs capability. I know, I've frustrated
myself with them thoroughly! (And strained some friendships!)
Especially "current" baluns, which are mechanical nightmares.
(Outside of the naturally occuring 4:1)

Your comments also seem to be lumping baluns together with decoupling devices.
Although they do overlap, for this antenna they need to be distinguished.
By the strictest definition balun means a transformation from an
unbalanced to balanced condition or vice-versa. Feed line radiation reduction
then becomes a side benifit of not having imcompatible systems placed together.
Like feeding a 1/2 wave dipole with coax directly. Here the antenna currents
are in phase at the feed point and it needs to be fed that way.
In the jpole, the stub currents are out of phase and likewise, it needs
to be fed that way. Again I'll hammer this point - care must
be taken when feeding and adjusting this antenna! All the decoupling in the
world won't fix a poorly handled feedpoint.

The most I could ever recommend someone adding to a jpole feed point is a sleeve
choke as a decoupling device, not a balun. The jpole feed resembles this in first
place though.

>to be used on signals that might have some dF/dt doppler component?
>Please Help.

Good question. The doppler on EME and MS shouldn't be sufficient to require the wider filter, but if you want to do aurora, you'll find the wider filter helpful (and of course it's a must for modes like Clover, PACTOR, etc). In fact, my on the air experience with the FL-100 says it's almost ideal for Clover and PACTOR.

I'm not so sure the IC-706 is the ideal radio for EME and MS, however. I think the FT900 or the FT1000D would be better choices to back a good transverter. The receiver dynamic range isn't that good on the IC-706. I don't know how nasty the phase noise is yet, gotta put it on the bench and test that. It may be Ok, or not, can't say since on the air experience points to front end crunch as the more serious problem.

>--
>Steve Ellington N4LQ@IGLOU.COM Louisville, Ky

No, that's not what's happening. When you activate 1 Hz from 10 Hz,
of course the Hz digit will be zero since you've been tuning in
10 Hz steps. Try this instead, with 1 Hz active, tune to a 5 Hz
step while listening to the pitch of a carrier. Now press and hold
TS to go back to 10 Hz steps. You'll notice no pitch change. Now
press and hold TS again, and you'll find you still have a 5 in
the Hz position. But if you *tune* while in 10 Hz mode, the first
tuning step will jump to a whole 10 Hz frequency, and if you then
go back to 1 Hz steps, the display will correctly show 0 in that
position.

Even for 45 baud RTTY, the 250 Hz filter is a bit narrow since the
250 Hz is measured from the 3 db down points and doesn't represent
the flat response portion of the filter (45 baud RTTY is crudely
260 Hz). And besides, phase non-linearity becomes extreme at the
filter corners and you don't want your data signal there because
it will distort the eye. The 500 Hz filter is the better choice.

4577. IC-706 remote control

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-26 00:00:00 UTC
From: walter_crauwels@qmserver.vtm.be
Message-ID: <49a3cb$1kj@news.Belgium.EU.net>
Source record: 209971

Hi

I was thinking to control an ICOM IC706 on remote,
So the idee was to extend the 4 pins connector over an RF link

Does anyone know something about the protocol,or did someone
tried this yet ???

73 Walter ON4BCB @ ON6AR or Email me

4578. Info needed on MFJ-9406X 6m xcvr

From: rec@goodnet.com
Message-ID: <DInuMD.Lrr@goodnet.com>
Source record: 209972

is anyone out there using one of these yet?

Is it worth the $239??

Please leave me e-mail with your positive or negative reviews.

ps: does this radio also do CW? The picture of the radio I have is out
of focus and I can't see if there is a 1/8 jack for a key on the front.

>Am Considering buying the JPS ANC-4 Antenna Noise Cancller. Does anybody
>have any experience or comments on this unit?

Dave and Rox,

I have been plagued with an extremely high impulse noise on 75 and 160, here in So Calif. I contemplated building the low noise receiving antenna, as described in the Sept. 95 issue of QST. After quick calculations for investment of TIME and money, I realized that perhaps a gamble on the ANC-4 would be worthwhile. I purchased one Friday, 11-24.

I am estatic. it performs amazingly well. My S9 to 10 over noise level drops to S1 (REALLY)!

This is my personal experience. I am not associated with the JPS company in any way nor am I in the retail business of selling amateur radio related products.

From: Dave Hockaday <wb4iuy@nando.net>
Message-ID: <49ah73$jdb@castle.nando.net>
Source record: 209975

I just bought the rev. 4.0 firmware upgrade for my NIR-10. I must say, I think it's the best upgrade yet. It adds adjustablilty to the Peak mode, and "AUTO" to the NIR mode. The NIR mode is much smoother. and I don't notice the "processed" sound I heard in the NIR mode before. My ver 3.0 sounded a bit hollow when NIR and auto-notch was used, but it's not noticed in the 4.0. The "Auto"-NIR is slick...it's adjustment to NIR level is completely transparent.

Now to try one of those ANC-4's...I'm thinking of trying one on my 10 meter repeater. The receive site is a constant hassle for me and the local Power co. to try and keep the noise floor down. There is a 220 and 440 repeater at the same site, but the noise isn't a problem that high in frequency. I've changed the RX to one with a noise blanker, but that often isn't good enough. This ANC-4 sounds like the ticket. I have a preamp on the repeater rx, so that will probably compensate for insertion losses.

Consider not buying a filter but placing your money into a Timewave 59+ DSP
filter. I have worked (and still do) lots of CW over the years. I also have
250hz and 500 hz filters, I find the ability to go down to 25 hz with no
ringing (normal in an audio filter) and the ability to kill hetrodines on 40
a real plus... good luck on what every you decide....

: The bottom line is that audiophile speakers will generally perform
: poorly for communications work. Save your money for something useful.

Beautifully put. And for cw, I find a cheap, bare speaker with no cabinet
of just a metal, open cabinet tends to resonate within the desired audio
range and makes copy much better. Never use one of those sealed, hi-fi,
air suspension, suspended cone, large magnet full range speakers. Use one
with a small magnet and a stiff cone!

>73 Tom

I don't think I agree, Over the years I have used Cushcraft, Butternut, homebrew, and GAP verticals, I find that the GAP work better than any of the others. Yes my other verticals had radials down... However I think that ground conductivity plays a big part. Some friends were on a DXpedition to VP5 land. The butternut vertical with the radials in salt water worked better than the GAP, but not the same on dry land... Good luck on your dicision....

4595. Buckmaster HamCall error

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-26 00:00:00 UTC
From: ad7k@bighorn.accessnv.com
Message-ID: <49bn38$d11@bighorn.accessnv.com>
Source record: 209989

There is a minor error in the current (Fall 1995) edition of the Buckmaster HamCall CD-ROM ... Buckmaster Publishing is aware of it, and should have it corrected in the new (Spring 1996) edition.

If you enter the call look-up thru the "ICALL" entry, and find a call sign that --does not-- have a four-digit extension for the Zip Code (i.e., 12345 versus 12345-4321) listed, the Grid Square for that call sign will not be accurate. Note that the Longitude listed for that call sign will not be a negative number, whereas one that does have a four-digit extension listed will have a accurate Grid Square (out to the sixth digit) (i.e., DM26AA) listed.

If you would like an example, look up my call sign (AD7K) and note that I am properly listed in DM26, with the proper fifth and sixth character listed, and the Latitude/Longitude down to the "n-th degree". Then look up the call sign of my Assistant Manager, N7GBJ ... note that his Zip Code is in five-digit only (even though he has been at this residence for eight years - thank you, U.S. Postal Service!), his Longitude is not negative, and his Grid Square shows him half-way around the world.

Buckmaster Publishing says that this error affects only a very small percentage of the call signs listed in the database, and that they should be able to correct the error in their next issue of the disk.

As a side note, we at Amateur Electronic Supply cross our database against one of the more popular, high-level Zip-Plus-Four programs when we get ready to mail our 160-page catalog twice per year, and Tom's address does not convert what that program, either - that conversion is done at our IBM AS-400 at our Milwaukee, WI main office.

Very 73 to all!

"Squeak" Porray, AD7K
Manager, Amateur Electronic Supply/Las Vegas

4596. Need Info - 6m vs 2m

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-26 00:00:00 UTC
From: 75034.1566@compuserve.com
Message-ID: <49aui5$gok@dub-news-svc-3.compuserve.com>
Source record: 209990

Greetings,

Any radios out there that are both 2 and 6 meter? I am considering going 6m to start, but I'm not sure of the usage by others.

4597. TS450SAT for sale

Hi,
I'm selling my HF rig, mainly because I never use it. The rig is a Kenwood TS450S-AT in mint condition, covering all Ham bands from 160 - 10 meters. It is also an excellent general coverage receiver, covering from 50 kHz to 30 MHZ continuous. It has a built in antenna tuner, and the extra cost narrow band voice and cw filters are installed. Other features include: built in automatic antenna tuner, 100 memory channels, tunable AF notch filter, speech processor, and more!
A brand new TS450S-AT goes for about $1300 at HRO (discount from $1759 list price). I'm willing to part with mine for $1000, or best offer. Please contact me via Email at: sidell.ron@gene.com if you're interested.

Ron

4598. IC-706 CW with 250KHZ filter operation

Comments on 250KHz CW filter!!
This weekend I put in the FL-101 CW 250Khz filter into
my new IC-706. It sure works great for the CW Contest
this weekend!!
Also ran semi Break-in CW with no complaints.
A few don't care for full break in as it does not
respond fast enough for those 35+ Wpm CW op's on full
break-in well.
The radio performed great on CW with this narrow filter,
if your into CW, the 250Khz filter is great. If your into
packet, then get the 500Khz filter. If I didn't have the filter,
I would have had real problems copying stations with all the QRM
in the CW contest this weekend!!
Using pair of headphones is recommended over the speaker,
at least when using CW narrow, It sounds a little better, less
resonant vibrations over that little speaker in the rig. A larger
external speaker is better than thru the small speaker,
but both ways seem to work well, depending on the situation.
Very satisfied with the IC-706, have fun with your IC-706's
73
Mike

You might try Palomar Engineers! They sell them for a buck each.

Just make sure to turn the Tuner Tuner OFF when you are properly tuned up
on frequency. Then you shouldn't need any fuses.

: DSP filter will add to the selectivity provided by the IF filters,
: help reduce noise and help eliminate heterodynes when you're operating
: SSB. If I could only have one, I'd choose the IF filter. 73, John

Some of the latest radios sport DSP implemented "IF" filters and DSP demodulators.

DSP techniques offer some remarkable things:

A plethora of filter widths and shapes without increased hardware

New freedoms between amplitude and phase responses

Multiple notches with smart control (tone-seeking)

Sharp filtering without the usual amount of ringing

Tempting, n'est-ce pas? The problem is still the analogue to digital conversion. The very best ADCs available do not yet begin to threaten the spurious free *Instantaneous* dynamic range of the best analogue radios. So, even with IF DSP, the digital section is put late in a receiver's gain profile, possibly sheltered behind some AGC. If the DSP is creating your ultimate selectivity, then you are open to overload problems from large signals, outside your DSP bandwidth, but within the bandwidth of your analogue section.

DSP before or after demodulation is not the deciding factor, it is the inter-relationship of the profiles of gains, bandwidths, and dynamic ranges down the stages of the receiver that matter.

Ultimately, I think, fabulous receivers will be made around DSP IF structures, given further progress in ADC technology, but I think that it's fair to point out that currently, going to DSP means losing some capabilities in terms of hunting small signals close to very big signals, though such radios do sound marvellous under less demanding conditions.

I'd better add that I don't mean to suggest that all existing analogue radios are necessarily wonderful, some are truely awful. I mean the sort of thing that could be built by a well-read, genuinely amateur, home-brewer rather than the "features sell radios" stuff.

Cheers
David GM4ZNX

4603. Looking for documentation/contacts

Message-ID: <49bug1$68b@Bucklan.Stupi.SE>
Source record: 209758
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I have got a broken linear amplifier. In it's previous life it where located in the attic, close to the antenna and served it's masters well until the roof broke and rain water dripped into the operating amplifier.

Mixing rain water, 2.5KV, HF and TTL-circuitry turned out to be fatal...

It's manufactured by "Advanced Radio Devices" that used to be in Sterling VA, USA, apparently they are out of business since several years now. The model number is 230C

I have a manual, but for some reason they decided to not include all circuitry that has to do with communications between the actual amplifier and the remote control box (wich has a Z-80 microprocessor).

I'm trying to find the missing documentation of the hardware, and some insight to how the program actually works, so I can diagnose the IO-circuitry. If the SW has any diagnostic/production testing routines that could be handy etc.

If I manage to get this working I assume that all of it including the tuning presets has to recalibrated, but how?

Any information or leed to anyone who might know, would be most appreciated. (as a private email or call)

From: ve1alq@mi.net
Message-ID: <49cbqi$bqc_001@ve1alq.mi.net>
Source record: 209759

Hellow All;
I have forsale 1 Henry 6 & 2M linear. This unit was purchased 3 years ago from a University and was still in the shipping crate, ie never used.

It has a NEW matched pair of 8874's in it and will run a very easy 1200W output on both bands. The complete unit has 5.5 hrs of use. It also has 4 DK60 high power coaxial relays with it.

I am asking $900.00US plus shipping, the new tubes cost me $525.00 + $30.00US for matching them.

Only interested parties please.

Darrell Ward, ve1alq. Ve1alq@mi.net, or Phn 506 738-2734

Thanks & Best 73

Thom: Congrats on the 1000MP purchase. Sounds like a nice radio. I was talking with N4ZZ the other night; he's had one for a couple weeks. He drives an Alpha 87A (requires less than 50 watts drive). He found a bugaboo with the 1000MP in that you can not continuously adjust the power output on SSB, only on CW. Because of this problem he is considering sending the radio back, unless Yaesu can send him a mod. The west coast people are aware of the discrepancy and may do something about it. I had considered the 1000MP, but like N4ZZ I use an Alpha 89 amplifier and need the variable power option to drive it.

If Alpha 89 has an ALC output, this will drive down tyhe power on your 1000MP to whatever level is comfortable for the Alpha.

4609. IC-706 Comments and Questions

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-27 00:00:00 UTC
From: James Garland <garland@ohstpy.mps.ohio-state.edu>
Message-ID: <49cun3$hvm@pacific.mps.ohio-state.edu>
Source record: 209764

A few questions, re the IC-706, based on one weekend's experience with the radio:

1. AGC Time Constant: The time constant in the slow position seems to be several seconds, which is too long for my taste. I'd like to change it to about 1 second, presumably by changing a resistor or capacitor. Anyone figured out where the AGC circuit is?

2. Duty Cycle: Is the duty cycle 100% for key-down 100 Watts output? Does the rig shut itself down if it gets too hot?

3. Relay Control: I'd like to key a linear amplifier, using the accessory connector, but the manual is a bit vague on this point. It seems to suggest that the control output has two modes: (1) grounding the control line keys up the transmitter, and (2) keying up the transmitter grounds the control line. Somehow the rig accomplishes this feat without latching itself into a key down condition. Obviously, mode (2) is the one for controlling an external amplifier, but using it would seem to preclude using a foot switch or external PTT switch to key the transmitter via mode 1. Also, the manual doesn't indicate the current/voltage limitations for keying an external amplifier. Has anyone tried it?

4. Line (audio) Output: A fixed audio output line appears on the ACC connector, but the manual doesn't give the spec. I'm guessing it is about 1V rms at a fairly high Z, but has anyone measured it? A variable audio output (linked to the volume control) appears at the microphone connectors, which makes the rear panel mike connector unsuitable for packet control. I'd think a fixed level would be preferable.

5.Tinny Transmit Audio: A transmit carrier setting of -100 gives good base response for my voice, with excellent on-the-air reports. Some reports have preferred the audio to that of my FT1000D/Shure 444 combo!

Miscellaneous Impressions: The rig is clearly a tour de force for ICOM, and an amazing feat of engineering. Some of the quirks,noted in earlier discussion on this newsgroup, can probably be fixed with firmware updats. I wouldn't recommend the rig as a main station transceiver, since the menu-driven system is inconvenient and clunky. For day-to-day use, one needs a bigger front panel with dedicated switches for changing bands, selecting AGC response times, setting the mike gain, etc. And the manual leaves a great deal to be desired, in my opinion. Although written in clear English, it somehow manages to belabor the obvious (instructing the user to turn up the volume control to increase the volume, and to turn it down to decrease the volume (!)), while leaving out important specifications. It also is extremely repetitive, which makes it hard to

concentrate on while staying awake. For what it's worth, I paid $1259 for my 706, if you're into comparison shopping. If you bought yours for $900, please don't tell me.

Neat coincidence; I started this hobby in 1965 at the age of 14, too.
Built some from kits and some from scratch, collected pop bottles and
did paper routes to get money to buy. However...

...it didn't hurt when dad finally worked up the steam to get his
ticket, too. (BOY, did the ham shack get modern about two days after
his ticket arrived in the mail! :-)

Do you mean the Rayovac "Renewal" batteries? I don't think millenium are alkaline... I believe they are nicads. As for Renewals, I've had them for a year. They do take a charge OK, but the power in them, right from the start, is more like a carbon-zinc battery than an alkaline. They don't have much instantaneous current capability. For instance, a brand-new set won't start my camcorder (which has an alkaline holder), but normal alkalines run it just fine.

Source record: 209772

I just got my FT-51R back from Yaesu after they replaced the microprocessor with one containing the firmware for performing the 15 kHz step properly. Of course, all your programmed data is lost, so be sure to save your data with the Yaesu software if you have it. Turnaround time was 5 working days (will-call window at the Cerritos CA facility). I had to re-initialize the extended receive feature by pressing the up/down arrow keys while turning on the power, but after that (and re-programming memories) everything worked fine.

4620. RF choke color codes

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-27 00:00:00 UTC
From: "Colin Schmutter"
Message-ID: <49df0a$i2f@chopin.bcit.bc.ca>
Source record: 209775

I am a bit unclear as to how the color coding scheme applies to small RF chokes. The type of choke I am refering to look like small resistors and have colored bands around them.

I can see that the first and second band refers to a digit value as in a resistor but the multiplier band confuses me.

For example what value would a choke with the colors brown black and orange represent?

Any help would be appreciated.

>73,
>Bruce, WB4YUC
Hi Bruce,
Choke baluns (current baluns) are isolating devices. They are also baluns.

I said choke balun because a voltage balun would not isolate the
feedpoint. A sleeve type balun or a small coil of minature coax would be
fine. The J pole feed certainly "resembles" this when the feedline follows
the short element (or the element where the shield attaches) to the
voltage null.

I think we are saying the same basic things, just in different jargon.

> down to the last cycle

Steve-

I noticed this, but assumed that frequency was forced to the nearest 10 Hz, when the 1 Hz digit was not showing. As I recall, when a non-zero digit is showing when changed from 1 Hz to 10 Hz readout, a zero appears when changed back to 1 Hz readout. In other words, frequency steps are 1 Hz ONLY when the display shows the 1 Hz digit.

This is somewhat like the case where tuning steps are set to 1 KHz. Even though some non-zero digits may be displayed when the 1 KHz step is first turned on, the first time a frequency change is made, the display jumps to the nearest 1 KHz interval in the direction of the change, rather than merely adding 1 KHz to the prior reading.

If you put a tube (cardboard, plastic, etc.) of the right length on the
end of cheap speaker you can enhance your desired CW frequency tone and
it will help pinpoint the desired signal.

In article <DIo8r7.87x@iglou.com>

Mike,

If you prefer using a speaker for CW, but not the one in the radio, there is a good, fairly inexpensive solution. There is a 4" speaker made for the military by University, Adec and others. It comes in a "bullet resistant" die-cast aluminum case approximately 5" sq. by 3 inches deep, usually with a 600 Ohm -> 8 Ohm transformer inside.

Now, while it so far sounds like a clunker, ugly and tinny sounding, remember your elementary school teachers and don't judge a speaker by it's enclosure. Besides being nearly bullet-proof, they are also tuned for a narrow frequency response that drops off _Extremely_ sharply below 500 Hz and above about 2800 Hz. I've seen them tested and the graph looks like an inverted "U" with a wide bottom. It does a very good job filtering out extraneous signals outside the normal SSB passband, as the military intended. On CW it limits the amount of "garbage" you need to filter out to dealing only with signals already within it's passband.

As for availabity, I've seen them as low as US$2 at hamfests. A good commercial source would probably be Fair Radio Sales in Lima, Ohio. The model number on mine is LS-203/U.

> Greetings,
>
> Any radios out there that are both 2 and 6 meter? I am considering going 6m to start, but I'm not sure of the usage by others.
>
The new ICOM IC-706 HF radio also covers 2M and 6M, 10 Watts on 2M,
and 100W on 6M. Note that 6 meters is not very popular in areas
with a channel 2 TV station, because of interference with TV receivers.
(This interference may exist with other channels as well). 2 Meters
is probably the most popular ham band. I love 6 meters when the band is
open.

You may also find that any nearby source of RF energy, including an AM broadcast, amateur station, or semi-legal CB operator can introduce enough RF to seriously alter the apparently correct tuner settings. Palomar probably did mention this in their product manual, but the reviewer did not.

>
>
Nick, my first a.m. station in the '50s, a Johnson Valiant and a National
NC303 cost over $1000 and was ham band only and a.m./c.w. only. Today, about
the same $1000 will get you something like a TS450sat which would have
been considered science fiction back in the 50s!
Considering what inflation has done to food, housing, transportation, and
just about anything else you can name, our radio hobby has blessed us
with bargains that should be the envy of most other pursuits you can
name. Qwitchurbitchin, and enjoy the vast bargains available out there
for your dollar.

You might want to look for a Motorola Micor 135-150 Mhz. preamp. They are available from dealers for usually about $30, and make□ superb repeater preamps.
I agree with previous answers about power amps...MAKE SURE that they are rated for continous duty operation, and add about a 30% factor on what you're looking for in output power. That way you can run them throttled down, so to speak, and therefore a bit cooler.

Why don't you go to the rec.radio.scanner newsgroup and download
article number 40337. N7OLQ has the Kenwood address listed along with
many more you may find of interest.

To all, I would be interested in hearing about your experiences re: factory repair turnaround time for all the major radio companies. Please let me know exactly how long it took for the Kenwood, Yaesu, Ten Tec, or Icom repair factories to fix your radio. Who gave you the best, fastest service? The worst? Thanks & 73, de John, KI7JB.

4650. Battery available in Canada?

Newsgroup: rec.radio.amateur.equipment

I recently purchased a Yaesu FT-11R HT and am looking for a extra battery for it. Yaesu makes a FNB-35, 7.2v 900maH battery, but I was told it was "not imported" to the U.S. I was wondering if it might be available in Canada.

Could someone up there please find out for me? And/or provide a phone number of a good shop to call?

Thanks,

John

An important concern may be the insertion loss of the filter and the shape factor. I have found my old Drake R4/C will outperform my Kenwood TS830s. The Drake has a 250 cycle filter and the Kenwood has the 300 cycle unit. However the kenwood has a higher insertion loss and weak signals are often lost.

But, this isn't the same. All you have there is a limiter circuit. You will
lose the dynamic range in amplitude and, with it, some intelligibility. This
is something that has been sorely needed on some rigs for years. The earlier
solid state rigs included it, but the took it away.

>
>- Is there a product review for this radio in a magazine ?
>
November 1995 QST

>- Is it possible to connect an external speaker ?

Yep, you can either connect 1 speaker that will pass both VHF and UHF
together, OR connect 2 external speakers, and the radio will play VHF from
one and UHF from the other. There is also a speaker built in the
microphone, that may be enabled/disabled through the keypad.
>

Other comments:
I've had mine for about 9 months, and am very happy with it. Several
others bought them in our club, and the most noticable thing is the TX
audio. It is the sharpest, crispest TX audio I've ever heard.

Also, the intermod rejection isn't bad, but not as 100% foolproof as their
ads would lead you to believe. All of us that have them have a small
amount of intermod when in known bad areas, but these areas usually have so
much RF in them you can feel it in your tooth fillings as well. Intermod

seems worse on UHF than VHF, and may be partially due to mixing in the
built-in duplexer.

Good luck!

4657. Info wanted: Ten Tec 2510

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-28 00:00:00 UTC
From: kharker@cs.utexas.edu
Message-ID: <kharker-2811951537110001@slip-58-4.ots.utexas.edu>
Source record: 209565
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.equipment

I was window shopping inside Austin Amateur Radio Supply this
afternoon, and I came across a really old (1985) radio review reprinted in
a small booklet about satellite operations that seemed to focus mainly on
Oscar-10. The review was for the Ten Tec 2510, which apparently coupled
a 10w 440MHz SSB/CW transmitter with a 2m<->10m ssb/cw transverter and
preamp.
While this wouldn't cover every satellite mode, and it most certainly
wouldn't handle 9600bps packet (I'm also interested in working pacsats
some day)
if one could be had cheaply, it might make for a good starting point for
me. I've already acquired a cheap HTX-100 10m ssb/cw rig I could use with
it.
Does anyone own one of these rigs or have any comments on them?
About how much would I expect to pay if I found someone selling one?
Anyone know of a source selling these?

Nothing personal, Nick. But you don't have to be and EE to homebrew. The
basic concept is don't get stuck on all the bells & whistels, then you
can build anything. You don't need an electronics lab, a small table is
just fine. But the big differences, my own oinion, that ham radio is in
one's blood, not talking on the ham radio being the driving force for
homebrewing.

4664. FT51R RX range?

4666. ANC-4 Response from JPS

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-28 00:00:00 UTC
From: geo@nando.net
Message-ID: <49fffc$7ot@castle.nando.net>
Source record: 209574

Hi Guys and Girls,

I'm an Engineering Technician at JPS Communications. I took a copy of this mornings post to the Engineer who designed the ANC-4, and he asked me to post this response.

---

28 November 1995
PWP

Regarding the comments about the ANC-4's noise and overload performance:
Noise- Yes, the unit can introduce some noise at higher gain settings. While the noise figure of the noise antenna preamp is quite good (the input stage uses two low noise FET's), the problem is that to get a useable signal level from the electrically short, high impedance noise antenna, quite a bit of gain may be required. The high gain necessary to amplify weak noise antenna signals makes the ANC-4's noise apparent in the receiver. Another way of looking at the problem is this: when using an efficient antenna and good receiver at HF, particularly at low frequencies, the SNR is determined by atmospheric noise, not by receiver noise. But with a short, inefficient antenna, the SNR will be determined in the input stage, in this case in the ANC-4's preamplifier. (Of course, we want an inefficient antenna for the noise antenna because we want to receive only local noise.)

Overload- We're always trying to balance cost and performance in our products, so every product design involves a series of tradeoffs. One of those tradeoffs was the 3d order intercept point of the noise preamplifier, which at +17 dBm is about as good as it can be given the constraints of cost and available power supply voltage. We also chose to make the circuit broadband down to 500 kHz so it would be useful to BCB DXers and others interested in lower frequencies, knowing that there could be problems with overload from close-proximity BCB stations. However, assuming that you're operating in a ham band, the BCB overload problems are easy to take care of with a simple series-resonant trap applied from the noise antenna to ground. JPS will calculate and supply trap components free of charge to those experiencing overload problems from a BCB station.

Any further questions can be sent to jps@nando.net

What you have found (I believe) is a UHF power amplifier made by the now defunct TPL (not "I") Communictations Inc. company which stood for the owner, Thomas P. Litty. He made VHF & UHF power amps back in the '70's. He has been out of business for about 15 years or so I think.

They were not all that good I thought, but if the price is right, it probably is ok. You need to search for a model number on the label to find out what frequency it was designed for.

Good luck, Alan WA6AQC

Probably not the $1000.00 that the "original poster" paid for them.

When I got my ticket in 1975, I recall most new equipment (Kenwood, Yaesu) going for $600-$900,(Kenwood TS520, Yaesu FT-101s, FT-401Bs, etc), had tube finals, "dipper" type radios and ham bands only. Now you can get a general coverage receive ham radio, all solid state, no final tuning for around $900. Not much price difference, but a big performance difference.

Now I am comparing the more "bottom of the product line" radios - not the FT-1000 (compare those to Collins or Drake top of the line stuff).

I've been using the Rayovac Renewal batteries in a Tandy Zoomer Personal Digital Assistant for about 6 months, and have had pretty good luck with them. I agree with the other replies though, that they don't like deep discharge and won't provide a lot of current.

The problem I have is that the Zoomer sucks batteries dry (<0.75 volts) before it says the batteries are low. When the Renewal's get that low it takes 2 or more charge cycles to get them nearly all the way back. I'm on cycle 12, and they are just about at the end of their lives. I found the payback happens after about 5 to 6 cycles, if you figure the cost of (4 AA Renewals + 4 AA charger) vs 20-24 conventional AA Alkalines.

>Consider not buying a filter but placing your money into a Timewave
>59+ >DSP filter.

The problem with this approach is it's no good for weak signal work.
Strong nearby signals will activate the receiver's AGC and cause the
desired signal to disappear.

I work CW almost exclusively and Tom (W8JI) is right. A 250 Hz IF
filter is what's needed. The Timewave is useful as a secondary filter,
after the 250 Hz filter eliminates most of the junk.

RTTY is a different matter.

Bruce Burke <eaim103@email.mot.com> wrote:

>A high guass speaker, if designed for high frequency reproduction
>will be more sensitive than one with a low gauss rating. Or, will
>be more efficient.

Not if the voice coil gap is simultaneously made larger in order to handle greater power. Audiophile speakers with large magnets are inefficient due to their larger gaps, as well as their longer voice coils. Longer coils are necessary in order to keep the same amount of coil within the gap during long cone excursions. At any given position of the cone however, only a small portion of the coil is in the gap and energized by the field.

>It's power limitations will be both a combination of the coil
>structure and the mechanical limits the cone can move. For
>communications receivers, the audio output rarely exceeds 5 watts,
>therefore, it is easy to find a speaker that will handle the power
>electrically. Then the main concern becomes mechanical capability.

Even the mechanical requirements are not a significant concern when the power is limited to 5 watts and the frequency band is 300-3,000 Hz. Almost any cheap speaker will perform well in this situation.

<snip>

>Mostly this assumes the use of a large speaker, but it is true,
>a large speaker will poorly handle the highs needed in communications
>work. The voice coil will be unable to change the direction of the
>cone mass quickly resulting in not only loss of efficiency, but
>distortion due to "cone break-up."

No, break-up is a phenomenon that occurs at low frequencies as a result of excessive cone pressure. It almost never occurs at higher frequencies because cone movement and air pressure are much less substantial. Yes, the inertia of the cone and motor assembly is a major factor, but this causes frequency response rolloff, not breakup, and not harmonic distortion.

>Indeed, there is no need to seal the enclosure, but if you have one,
>just make sure that the volume of air inside is way above the critical
>amount for that speaker. (Vab)

This isn't particularly necessary from a practical standpoint. Critical volume is a function of the lowest reproduced frequency. Published specifications for this criteria assume the speaker will be used at its lower limit. The minimum necessary air mass for most

4" or 5" speakers at 300 Hz is probably about the volume of an egg. Cone-type audiophile midrange speakers with sealed backs often do have more enclosure volume, but this has more to do with elimination of unwanted resonances, speaker dampening, and efficiency matching in multiple-driver systems.

>Absolutely! I personally use an 8 inch PA horn for listening to voice
>communications. Otherwise, I use the 5 inch communications speakers
>from the professional two-way manufacturers, but they rank a distant
>second to the horn in my opinion.

A mid-range horn intended for audiophile use would also make an excellent communications speaker. However, the ones that extend down to 300 Hz are expensive and the mouth of the horn is large. They do offer extremely high sensitivity, but that's not useful unless you want to plug them it into the headphone jack.

Again, save your money.

I know this is in the wrong group, sorta, but if anybody could point me in the right direction.

I am creating a 2 station internal phone system. I have a 12-volt bias on the line. Everything works fine.

ONE CATCH: When phone A is picked up, I want phone B to ring. When phone B is picked up, I want phone A to ring. Not continuosly, but 1 ring of 4 seconds (standard) would suffice. This should be automatic, i.e. no buttons to push, as I have a cordless phone as one of the ends.

I am looking for either a manufacturer or schematics.

Thanks

I would suggest Astron. I've been using an RS-20A for over 20 years. I did have a problem with it once. RF got into it and it stopped working. Astron repaired and modified it at very reasonable cost. That was 15 or more years ago.

I also have a newer RS-35M. Yes they are somewhat large and heavy but they sure work like a champ. When I first got the newer one I measured the output with a Fluke DVM and it was exactly 13.8 VDC. It is very "stiff." When the power supply is turned off, it takes about 4 or 5 seconds before the radio actually goes off.

I can't knock other power supplies since I have no experience with them, but you can't go wrong with Astron.

I've had that problem too, and it's a point that seems to be lost on
newer radios. In fact, I seem to remember some older rigs (or was it
homebrew designs?) that incorporated gain adjustment in filter selection.

This is the same principle employed in ported speaker designs, except
they tune the air mass of the entire enclosure. Tuned columns were
also used on a number of speaker designs in the 50's and 60's to
resonate drivers at low frequencies and provide a narrow-band increase
in low-frequency efficiency.

Hear, hear! If anything there are more reasons and fewer excuses to homebrew today than say 20 or 30 years ago. All kinds of great stuff available, and it's cheap: DC-light MMIC amps with 50 ohm inputs and outputs, single chip receivers/transmitters, pre-built double balanced mixers, etc.

Pick up a Lafayette or Allied catalog from 30 years ago and see what prices were like in the "good old days."

As far as building your own printed circuit boards goes: So what? It sure beats point-to-point. Get a copy of shareware Pads/PCB and have at it. Print mirror image artwork on a laser printer, iron it to the PC board and etch. Or scan magazine PCB artwork on your PC, print on laser printer, etc.

Now on the soapbox for my pet peeve:

People who whine about how some new or different idea will never work.
People who are never willing to experiment or try anything different.
Note: This is not limited to hams.

On a drive home I mentioned a magazine article that used wireless VCR Rabbits to make a 900 mhz ATV station. (You just add BNC connectors and a 12-volt amp module.) Our local whiner thought it was all foolishness that could never ever work. Not only are these sniveling simps too afraid or ignorant to build anything, they feel the need to put down those who do. If all hams were like that we would still be using spark gap transmitters.

(Steps off soapbox.)

I've received several e-mail messages asking about how to test a FT-51R for the 15 kHz step problem. Set the VHF step size to 15 kHz and key in 146.52 MHz from the front panel. Next, step down one with the top knob. If the display now reads 146.505 MHz you're OK; if it reads 146.50 MHz you need the mod.

==========

Chris,

I recently used a brand new Ten Tech Scout that a friend insisted on loaning me during one of our trips out to the Eastern Tennessee area.(actually very near the Ten Tech location) In reality, I initially figured that he thought I would be a great field tester but I now think that he was tired of looking for me on 20 Meters / QRP / CW.

Short story, I was very pleased with it. I used it both mobil and portable with hamsticks for 20 and 40 meters attached to my car and the frame of my tent. I powered it with a 120 amp hour marine battery and did not even worry about recharging the battery until the 4th day; I only did that because I had the AC to do it at the time.

I kept several schedules with friends back in the Houston area with what I consider to be highly compromised antennas. I found that the 50 watts was plenty if band conditions were OK and the receiver seemed to operate almost as well as my Kenwood 850 SAT back at the house. I did buy and install the noise limiter but could not really tell it made much difference. It would likely be better tested in different cars with more noise than I had. It just seemed like a good idea at the time.

All things considered, it is a fine piece of equipment. When you can now buy a new Kenwood TS-50 for around $900, I wonder if the money would be better spent buying the Kenwood. If you take the price of the Ten Tech Scout, add in the costs of all of the bands (even though most will only use a couple) with the noise limiter, would you not be better off buying the TS-50? Maybe yes, maybe no. If you are looking for your first radio and can live with a couple of bands, the $300 or so

difference might be better in the bank than in more radio.

Message-ID: <49ds2kjnt2@mhafm.production.compuserve.com>
Source record: 209793

There is a technical paper out on the "Renewal" brand rechargable
Alkaline batteries you can get by calling 800-237-7000. They
are supposed to be about like other alkalines the first time
around, and then steadily lose capacity. I use the AA types
in various portable radios, CD players and scanners.

Alkalines in general don't have much surge current capacity, so
are not suggested for transmitters like high power HT's.
Renewals do not like to be deep discharged, and have no memory
properties.
I was deep discharging mine (long years of ni-cad practice)
and was ruining quite a few. They have a modified design from
the throw-away models, and use a fast-pulse charger. The
chargers cut out at about 1.6 volts- "bad" batteries won't
charge that far, and the red light stays on on the charger.

I have not seen the claimed 25 cycles, but have gotten as far
as 5-6 so far. (About 5% of my batteries fail every charge, so
I may not get to 25 cycles). Shelf life (and self-discharge
rates) so good that I sold all of my loose Ni-cads at a recent
hamfest. I still run the stock Ni-cad packs and fast
chragers for those rigs where I have them.

Jim, I've used the Astron 35A for 5 years. I did have the on/off
switch go on me a few years back and they sent me a new one free of
charge with no questions asked. They seem to be extremely well built
and the service was great. I'd buy an Astron in a nano.

I just caught the tail end of this thread, so forgive me if I cover some old ground.

I use a Radio Shack Cassette recorder AM/FM clock radio combination to record at selected times. Set the radio to the desired freq, set the clock to wake to music, and the selector to radio, then set the alarm to go off at the program start time. Press record on the tape drive, so when the alarm kicks in, the radio comes on, and the tape starts.

Source record: 209800

A couple things to keep in mind about the ANC-4. It introduces some noise of its own... if you are seeking weak DX signals near the noise level, be advised that the unit will RAISE the noise a bit. This is not a problem with stronger signals.

The ANC-4 is also overloaded without too much difficulty by strong RF floating around. If you have powerful local MW broadcasters this may be a down-side to the ANC-4.

It's a shame that JPS did not use a higher quality preamplifer circuit for the unit (i.e. lower noise, higher 3rd Order I.C.P.). I know this would have added to the cost, but it would have made the ANC-4 more useful to more people.

4714. Alinco DR-600 losing its memory

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-29 00:00:00 UTC
From: jimw@nando.net
Message-ID: <49gcva$frq@castle.nando.net>
Source record: 209608

I have an Alinco DR-600 dual band VHF/UHF mobile transciever. It's about 18 months old. Anyway, it's developed the annoying problem of losing all of its memory settings intermittently. Sometime it will go a couple of days before losing it. Other times it will lose it just by turning it off and back on.

I've replaced the lithium battery located in the removable control head. That hasn't helped. The battery I replaced it with wasn't from the factory, but was a solder in 3v lithium.

If anyone else has experienced this problem and figured out how to fix it, I'd like to hear about what you did.

Otherwise, I guess it's a (probably expensive) trip back to the factory :-(

Thanks in advance.

>it. I had considered the 1000MP, but like N4ZZ I use an Alpha 89
>amplifier and need the variable power option to drive it.
>
>Ron,, W4VR

Ron, guess I'm missing something. I've never had problems driving the Alpha amps at less-than legal limit by reducing the carrier drive or the microphone gain. I mean, I've used radios with amps (like the 77DX) and simply cut the mic gain down to reduce input drive to the amp. Provided you use an ALC feedback circuit from the amp to the rig, there is no risk of overdrive.

From your message, is that to say that the 1000MP's RF PWR control only controls the carrier / drive, and not the ALC on SSB? Why not just reduce mic gain like we did on older tube-final HF rigs?

Unless you want to drive the amp at less-than-legal limit, wont the ALC feedback from the amplifier to rig automatically reduce the exciter drive to adequate levels ? Or, are you saying that the ALC input jack of the 1000MP does not operate?

Just curious. This is the first I've heard of this problem with the 1000MP, but then what do I know!

From: rickcrider@aol.com
Message-ID: <49h3v6$9eo@newsbf02.news.aol.com>
Source record: 209617

Thanks to all who responded both email and to the group.

Here's what we've done. (And, thanks to ya'll, everythings in the right place.)

Repeater: Micro Control Specialties, Mark 3 CR, Rack Mount

Amp: T E Systems 1412 R, rack mount repeater type, 170 watt.

Power Supply: Astron RM-50M, 50 amp metered rack mount.

Duplexer: Telewave TPRO 1454

PreAmp: Custom made and expensive, but generic looking, by GLB.

All this rack mounted in a beautiful 5 foot tall beige colored communcations cabinet, found at a surplus store. (For $40.)

Repeater site is at our regional State Highway Patrol Communications center. Rack rolled up right next to their impressive array of repeater and gadget systems. Polyphasers, the whole works. Even a Catepillar (sp?) emergency power generator large enough to run the entire facility. The radio room itself is backed up by a room full of lead acid glass jar type batteries just in case the generator quits. VHF antenna by Decibel Products mounted 240 feet up on the top of their microwave tower.

System installed this past Monday. Works great with one exception: Lots of extra power though the receive capability is terrible. Worse than before the added improvements. Our theory is that the duplexer cavities need realigning, and that the extra power is desensing the receive capabilities. Repeater is putting 30 watts into the amp. Amp is putting out 135 watts into the duplexers. Only 90 watts coming out of the duplexers. Losing 45 watts and lots of receive somewhere in there. SWR is not a problem. Any ideas on this appreciated.

Thanks again. I'll keep you informed.

What was the last (most modern) TenTec transceiver that did *not*
use a PLL system? I am thinking of scouting around for one, and
want to buy a radio I have a chance of repairing myself. The PLL
area tends to be propreitary and difficult to troubleshoot.

Hi, Chad. You might try a Discone in the attic (Radio Shack or other brand). Also, consider a dual-band mobile antenna with a counterpoise arrangement. These are commercially available, or you could build one yourself and mount the antenna on it.

Or... install an antenna on your Mustang and run coax into the house ;)

Heathkit did not die as a direct result of the lower cost of Japanese
>"appliances." It died because our society stresses convenience and instant
>gratification, and places little or no (often negative) value on hands-on
>labour and personal accomplishment.
>
Well, it is just a little more subtle than that. The Heathkit model
that sold the best, more of them than any other, was the venerable old
"Twoer", sometimes called the Benton Harbor Lunchbox". I shamelessly
admit to having one of those old behmoths back in the engineering cage
somewhere just to show me what fundamental simplistic engineering can
accomplish. When Heathkit decided that they had to have all the bells
and whistles of the offshore junk and charge accordingly, they died.

Today's ham (and I speak for the great unwashed majority, certainly
not ANYBODY interested enough in the hobby to read this article) makes
his/her buy decision based on how many goodies the box has. Is it
smaller than a matchbox, 1100 memories, puts out a kilowatt powered by
a flashlight battery, a readout that puts a stoned spider to shame,
buttons on front, top, side, back, and a secret reset series of
dipswitches on the bottom that double as a carlock mechanism when you
detach it.

And only used on the vfo to talk crosstown to other goofs who can't
remember how to program THEIR rigs either.

If somebody (and I speak as a design engineer as well as a minor
manufacturer of ham gear) comes out with a bonehead simple 2-meter rig
that has ten channels with +/-/s offsets and all the pl freqs
(internally EPROM controlled and changeable at the factory or locally
by anybody with a simple EPROM programmer) and can sell it for $99,
they are going to make a fortune. To hell with the secret tone
squelches, the hi-lo power switch, the clock, the timers, the handy
pocket clip that doubles as a pencil sharpener and the alarm that
sounds your anniversary. You want an egg timer? Go buy a West Bend.

Sorry, the soapbox got to me. KISS and BURP.

millenium --> Renewal(tm)

Well, I just did a rather in-depth study of them for use in aircraft hand-helds and wrote an article that is due to be published in "KITPLANES" magazine in January or February. You might want to get a copy of that magazine. Failing that (copyright laws and all) I'll post a copy of the article (less photos) in my ftp site and you can download it in March. Sorry about the delay, but my editor has first publication rights.

The bottom line, though, is that they are the best thing since bottled beer for a medium-power handheld, ESPECIALLY if you RTFM and recharge them BEFORE they get so low that recharging is a real effort for them. I've got a set in my 2-m Kenwood that have been there for two years, weekly if not daily use, and I must have 50 recharge cycles on them and they still test in the high green on my loadmeter after charge.

>that the unit will RAISE the noise a bit. This is not a problem with
stronger
>
>signals.

It would have to add some low level noise, since the noise from the sense antenna and the outside antenna are not the same.

Remember how it works, it requires identical noise sources to canel. If the imnternal antenna picks up noise the external antenna does not, or if the different noises have different phase variances between the two antennas, the noise will not cancel and can actually add.

If you want to overcome this problem, you nead a clear area for a direction receiving array!

The pre-amp may not be as bad as it seems, this is probably the most difficult application in the world for a pre-amp!

>(Outside of the naturally occuring 4:1)

A very effective balun that is easy to build is to use a coil
of miniature coax and stick it inside a piece of aluminum tubing,
such as a yagi boom or mast support. By paralleling quarter
wavelengths of 75 or 50 ohm coax, you can even do a bit of impedance
matching for that portable yagi. If you use square tubing, you can
drill and tap holes for a BNC or N connector. Maybe not the lowest
loss, but you can build a pretty rugged antenna to take on hikes.

4742. Yaesu FT-1000MP: Reality Check

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-29 00:00:00 UTC
From: "Paul Christensen, N9AZ" <paulc@jax.se.continental.com>
Message-ID: <49i6a8$g97@usenet.continental.com>
Source record: 209636

For those of you with pricing questions concerning the Yaesu FT-1000D and FT-1000MP models, consider this:

A $2800 street price FT-1000MP will end up costing $3875 when you purchase all the I.F. filters, and the high-stability TCXO reference oscillator (Included in the FT-1000D).

The purchase price between the two becomes very close when we compare apples with apples. Chip Margelli, Yaesu's Service Manager confirmed this today.

4743. Astron Power Supplies

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-29 00:00:00 UTC
From: James Garland <garland@ohstpy.mps.ohio-state.edu>
Message-ID: <49i77h$pl@pacific.mps.ohio-state.edu>
Source record: 209637

Astron power supplies work as advertised, but are definitely not
commercial-grade instruments. The internal wiring is definitely not
"pretty." I have a 50 Amp 12V model with meters, and was shocked at the
internal construction. I ended up rewiring it because I
couldn't stand to look at it. Furthermore, various external bolts on the
cabinet were at the postive unregulated voltage. Your best bet would be
to find a used Lambda or Kepko supply. Either will outlast the buyer.

>Cordially:
>Rick Crider kd4fxa
>UCARS (Union County Amateur Radio Society)
>145.39 Mhz, (down 6)
>Monroe NC

135 watts in and 90 out is about a 1.5 to 2 db loss in the duplexor which is pretty much what you expect. When you tune the duplexor make sure you have the open port terminated with 50 ohm. putting a dummy load or 50 ohm 3 or 6 db pad on works well. Get a spectrum analyzer and tune using it. Make sure that all of your cables and connectors are perfect. Double shielding on all coax is required in a high RF site as you describe and when using 135 watts out. Using N connectors will sometimes help the desense problem.

Try without the preamp. They sometimes are the culprit if not tuned properly. Also try turning down the gain on the preamp a few db. Sometimes they ossilate when run a max gain. You are using the preamp for its low noise figure rather than the high gain anyway.

Good luck!!!!

4748. IF filtering/gain question

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-29 00:00:00 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <3717.817623588@safety.ics.uci.edu>
Source record: 209642

I am reworking a Kenwood TS 130V and just added another crystal filter (two 8 pole filters, monolithic design), and I plan to move the noise blanker in before both filters. I also want to add a little more IF gain, got a Ten Tec wideband RF preamp and plan to stick it in there at the 9 MHz stage. Would it make sense to put it before both filters, or in between, or after? I figured to put it between the two filters, but it is just a sense I have.

I also have to do some impedance matching, the preamp has 50 ohm input and output, whereas the filters are 2 K input and output. Any hints on how best to do this? Wind two little toroids? Where would I get design info on how to do it?

Along similar lines, the mixer stage uses a pair of 3SK74's. Anyone ever replace these to come up with a mixer capable of more signal handling? I get easily overloaded with an outboard preamp, and wondered where I could improve this situation. I think my 130 uses the bandswitch to switch in the bandpass filters for the receiver, so diodes are not the problem.

Any ideas?

Clark

Source record: 209643

I spoke with Chip Margelli, Yaesu's Service manager this morning. When driving an external amp, you presently have two choices:

1) Use the ALC from the amp to regulate the transceiver or,

2) The method I prefer: Use an adjustable constant voltage source at the ALC connector. This can simply be a potentiometer connected to a 12 volt power supply with the pot's wiper arm connected to the ALC jack's inner conductor. You should consider using a current limiting (1,000 ohm or so) protective resistor on the pot's wiper arm.

Hopefully Yaesu will address and correct for this. I have *never* used ALC on my amplifiers in the past. Their operation seems to be erratic and difficult to properly match between the various amplifier and transceiver manufacturers. Instead, I use a Bird peak-responding wattmeter and adjust the transceiver's drive level to the desired amplifier output level.

I talked to the ICOM folks a week ago (November 22) in Washington State, here in the U.S., and they sent me a schematic. It isn't the best quality (being made on a copier), but most of the text can be read.

I've been curious myself, about the control protocol used between the control head and the main radio. I don't know anything about that yet, but I do now know something about the signal lines used.

There are separate transmit & received data lines, from the control head to the radio, and from the radio to the control head (it's not a shared bus). I don't see any sign of clock lines, so I presume the signals are sent in an asynchronous format, where there isn't too critical a requiremnt to synchronize the control head to the radio (as with a 'start-stop' protocol like 5-level Baudot Code). If I get brave I may put a scope probe on the lines, to see if I can tell anything about the data simply by observation.

Wouldn't it be convenient if we found that the control head to radio data is something simple like a 10-bit code, at a data rate that a PC could generate? Then we could 'write' our own control head in software.

I have a LUKE power supply and it is a first-class, commercial grade supply that has exceptional RF filtering. They make supplies primarily for the military and the FAA but have advertised in some of the Ham mags. They are located in Michigan and don't sell any small supplies (i.e. less than 50 amps).

What is so funny about that.

There are a lot of 900 MHz stuff that operates close and in the ham
band at 440 and 900.
Look at your Rabbits and other 900 MHz tv extenders
they operate AM , FM and SS<Phones>

Bandplans.... They can be fun

I believe that was the Kenwood TS-180. I worked lots of CW back then and
remember the rig having extra gain when switching in the narrow filter. I
liked this feature and wish it was included in the current crop.

Jim:

Last Saturday (Nov 25th) was 'ICOM Day' at Tucker Electronics, in
Garland, Texas (where I live). A couple of guys from ICOM were there,
and I asked them that same question (regarding duty cycle).

The answer I got left me a little unsure but ... here it is:

"Yes ... 100 % duty cycle" ...but then they said
"the radio will cut-back power if it gets too hot"

So I guess that's kind of a 'limited' 100% duty cycle ...

I still can't figure out how that little radio can generate 100 Watts
RF output. My Tentec Paragon has a heatsink that's got almost as much
surface area as the whole IC706. Of course the 706 uses 'forced-air'
cooling (that itty-bitty internal fan), and the Paragon depends on
ambient airflow over its external heatsink (although on RTTY I've
been known to turn a fan onto it).

I presently own an Argonaut 515 and wouldn't give it up for anything. It is truly Ten-Tec's gem in the Argonaut series. I was fortunate enough to have found one new-in-the-box with all the options about a year ago.

In comparing it with other QRP rigs, its greatest asset is in its preselector circuit. I don't believe there is another QRP rig with it. Its only drawback is its size. By today's small QRP standard, it is too large to accompany you in a backpack, but it's certainly portable enough and quite light. The current draw in receive is on par with the Index Labs QRP Plus and therefore can be run a long, long time with a gell-cell power source.

Finding an Argonaut 515 is very difficult and when you do, be prepared to pay between $350 and $550 for one depending on its condition. Like all Ten-Tec radios, its QSK is flawless.

Ten-Tec made a matching model 405 50-watt amplifier for the Argonaut line. They too are scarce, but I have seen them on the used market for around $150 or so.

I'm thinking about buying a Yaesu FT-990DC. I want to control it with a computer. Can anyone tell me where I can find documentation on what commands are available to control the rig, and also what parameters you can monitor with the computer (i.e., frequency, S-meter readings, operating mode, etc.)? I need detailed information. Is it, as I hope, in the manual(s) that come with the rig? Or do you have to purchase additional manuals from Yaesu to find this information? Is there anywhere on the WWW that this info is available? Thanks very much...

What are the ramifications of having this mod performed?
Loss of programing/undocumented features perhaps? Couldn't you
set the step size to 5 khz and get around this problem? I
just finished programing mine the way I want it and I don't look
forward to doing it again for a while. :-)
What did you have to do to get Yaesu to perform the mod?

Thanks.

Subject: Emily Postnews explains how to spam the net
Newsgroups: alt.current-events.net-abuse,news.admin.policy

Q: Emily, how can I put out my billboard on the information superhighway?

A: The best way to do it is to perform a spam. It's called that because everybody loves it as much as the customer in the Monty Python "Spam" sketch loves his spam.

The best way to do this is to find some naive programmer and ask it to write a script that posts your message to every newsgroup. You'll start by getting as big a list of newsgroups as you can find. The members of USENET, hoping to see your ad, have prepared these lists just for you. It doesn't really matter what your product is. If people on the net might use it, they'll be happy to read about it in every group.

Now create a message promoting yourself. Be bold, be daring, and be sure to provide info on how to contact you in ways that people on the net can't shut off. (More on that later.)

Because the reaction is going to be so overwhelming, be sure to take the following steps:

a) Unlist your phone number. The networking public is going to want to contact you so much to talk about your product or service that they'll even try to call you at home. If they get your home phone or address, they'll be sure to share it with all the other people seeking to send you their admiration, and your fame may prove too much. You want business, of course, but do you want to take orders all night?

b) Get an account with some other internet account providers. For reasons not quite certain, your provider probably has a clause in their contract with you saying not to do this. Even if they don't, they will probably delete your account a few hours after you announce your product, so be sure to get other accounts under assumed names so you can follow what's going on. This is the reason that expecting E-mail replies to your ad won't work.

c) Be sure you've led a clean life. You and your product are going to become as famous as Gary Hart and O.J. Simpson! But, as you know, such fame has its downsides, as your eager fans research every tawdry episode from your past history. So be sure there are no skeletons in

your closet. (Unless your product is skeletons!) Of course, since you're no net-communist, you probably have had a clean life.

d) Due to the Brady Bill, you may want to file your firearms acquisition permit a few days in advance of your ad. Soon you're going to be rich, and you'll need to protect that wealth.

e) Load plenty of fax paper in your fax machine. Hire extra staff to load the rolls. There may be orders in all the faxes you will get.

f) Resign any memberships you may have in any professional associations you may have joined relating to your business that might have something as pesky as a code of ethics. Why put them through the trouble of handling all the calls from your adoring fans, looking for somebody to talk with about you.

Ok, now you're ready. Unleash the posting program. Have it send your message once to every group. There are thousands. Now picture in your mind the prospective customer. She starts her day, perhaps, reading a group about her hobby. And right there is your ad! The title is curious so she reads it. Your name is now inserted into her mind -- you've got mindshare. It's true your product didn't have anything to do with her hobby, but the net is there to find customers for you, not for people to share their thoughts.

Then she goes to her next group, perhaps about her brand of computer. There's your ad again! You've sneaked into the great demographics of the high-tech world. As she goes on, she sees your ad again and again. Imagine her joy as she sees your now familiar headline everywhere she goes. "Wow, they must be really big and important," she'll think. "They're as famous as IBM." Soon that joy will be so much that she'll be ready to buy, buy, buy.

Now comes the bad news. USENET is unreliable, and postings don't always work. So, for unknown reasons, a few hours after you make your postings they will all have disappeared. Normally you would just post them again, but by this time your internet mail access will have been deleted, as I said above, so you'll have to just sit back and bask in the adulation and orders. There is a theory that some people, who don't like your ad, will have a smarter program than your posting program root around the net and stamp it out, but I hardly think it's likely anybody would do that.

There will be some people annoyed, it's true. But the net has at least 10 million people on it, and you'll probably only *really* annoy perhaps 3 to 4 million of them -- a minority!

Others who have tried this have reported not only that a mere minority show displeasure, but that vast numbers of people take the time to send back inquiries and orders just so you can have more to read. Unfortunately, they rarely actually pay. Some theorize that those in the vocal minority who don't like you are sending in pretend positive responses, to waste your time. Who would bother to do that? Perhaps just 1% out of the 3 to 4 million annoyed people, at most. That shouldn't bother you too much.

A similar percentage may try to phone you, or fax you, or send bricks postage due, or subscribe you to magazines. Ignore them. They're just 40,000 or so of the lunatic fringe, communist element you find on the net. They're just upset because you're making money and they're not. In fact, suckers that they are, they actually ended up paying to transmit your ad everywhere. Learn to ignore them. (That's not advice, it's just something you'll have to do.)

Now at this point you probably have to stop answering your phone, but keep those faxes coming in, and of course get ready for the mail. If you ever do get to see some of the E-mail you got sent -- wow, what a flood!

When it settles a bit, threaten to sue anybody who didn't like you. That should put some fear of God into them. They should have known better than to build a system so open. Sure, they built the network as a cooperative effort, but if they didn't want your ads, why didn't they put in protections against them or enact laws to stop them? What you did was probably legal, so what's their complaint? They're like people who leave their keys in their cars and whine when they get stolen. Really, like they didn't deserve it. They just don't see the wonderful new purpose to which their network can be put, to help small, exciting firms like yours get famous. That's the American dream, after all, and you're living it, or will, when the time comes to come back out of your bunker and reconnect your phones.

>difficult application in the world for a pre-amp!

Good points, Tom. The residual noise is probably unavoidable since neither the receiving antenna nor the noise antenna will EVER "see" the *exact* same RFI.

Personally, I'm very partial to passive solutions which cannot introduce intermod or noise, such as the noise-reducing horizontal loop antenna featured in the Sept. QST. I built mine for the middle of 90 meters (3300 kHz) and it is dynamite on powerline and TV oscillator noise on that band. It also works well on 60 meters, where I also DX. The antenna can knock a S-8 or S-9 noise level back to S-1 or 2.

Yaesu 2100B 600 watt linear. This rig has a dark gray refinished case, not the puke green that it came with. I fits in with almost any station because of the pleasing color. The 572B's are almost new (less than 10 hours), and are NEC's not the cheep Chinese that seem to find there way into For Sale Amps. It has the 10-12 meter mod so it puts out near full power there. It is in perfect working and cosmetic order. Double packed, insured, shipped to you door COD. $500.00

Source record: 209672

>>How do the new "millenium" rechargable alkalines compare with
>>nicads in terms of power output and life?

The first point I will make is how bad nicads are in the first place, so bad that they cannot be trusted for emergency use, hence, most of the equipment I serviced designed for emergency use had all the nicads replaced with nickel-metal-hydride batteries. Unfortunately, these are a little bit to expensive for the Amateur Hobbyist.

We use Ray-O-Vac Renewal batteries in almost everything else we operate!

The downside to the rechargeable alkalines is that they do not produce the current that nicads do, but it is higher than regular alkalines throughout it's cycle.

Another downside is that you cannot allow them to run below 1 volt per cell or they take several cycles to regain a full charge, shortening their life.

The upside is they do not pick up a memory block or grow whiskers that cause internal resistance draining.

On the upside, they are very inexpensive. If charged before they are drained very far, you can easily expect over 50 charges on each cell.

More on the upside, once charged, you can plop them on a shelf for extended periods of time and they will be ready to go when you need them.

If you don't mind a little extra weight on your belt, you can make a series parallel powerpack that will weigh just a little more than an equivalent nicad pack and have 1/3 more punch for the same voltage.

Yaesu:
Well, once I screwed up and toasted a trace on my FT747's main PC board. It was back, in fine condition, in about a week. BTW although its warranty was still in effect, and this was obviously my fault, it was repaired at no charge to me. (I accidently shorted the 13.6V output with a bad keyer cable) :-(

I have had no reason to ever use Yaesu's excellent service again, but I've bought several of their rigs. And service is one of the main reasons that I have.

James.Molinaro@Microserve.com (James Molinaro) wrote:

>What is the best commercial antenna tuner for high power?
>What is the best configuration for a tuner ,pi,t,ect.. , and where you
>would use each configuration, tube amp,transister outputs , ect..?
>Why do you use one configuration over another?

The Pi-network and T-network are both used to feed an unbalanced (coaxial) load. In either case, the tuner's role is to match the feedline impedance to 50 ohms for the transmitter. The type of transmitter is not a significant factor, because all current Amateur transmitters are designed for 50 ohms.

Comparing the two types, the Pi-network constitutes a low-pass filter. While I personally prefer this design, the need for additional filtering after the transmitter, and the ability of the tuner to actually suppress VHF harmonics, are both questionable. The T-network using the same components is essentially a high pass design and offers a greater matching range than the Pi. Both tuner types are often sold in conjunction with an output balun, in order to feed balanced feedlines, but efficiency of the balun can suffer greatly if the input impedance to the line is not reasonable.

A third type of tuner is designed to primarily feed open wire or ladder line and uses link coupling to convert from the transmitter to a balanced output. This type tuner does not use a balun, and will be reasonably efficient with any feedline impedance which it can match. There are many possible component configurations and the link may be placed at the input, the output, or somewhere in between. No one I am aware of currently manufacturers these tuners, although quite a few exist in construction articles.

The last type is one that only a few hardy experimenters seem to be using. It consists of a balanced Pi (2 series coils and 2 parallel capacitors) or balanced T-network (4 series capacitors and 1 parallel coil). In either case, the balanced network is preceded by an *input* balun, in order to supply the tuner components with a balanced source. The merits and shortcomings of this general arrangement are still being debated.

As far as the best tuner, it depends first on the type of antenna and feedline you plan to use, and second on the quality of components in the tuner. The latter will be reflected in the price, and it's probably fair to say that the more you spend, the more substantial the tuner will be.

The current OMNI VI from Ten Tec has an internal switch to include more IF gain whenever you use the NAR switch to switch in additional CW filtering. You really need it since it is the 3rd filter in line at that point (there is a 2.4 filter in line at 9 MHz all the time, this puts my 250 Hz filter right after that at 9 MHz, and I can put in the other 500 or 250 Hz filter in the 6.3 MHz line.) Didn't know the TS 180 had that feature. It certainly is a good one.

4795. Re: Power supplies: Astron or Daiwa or other?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-30 00:00:00 UTC
From: QRP%mimi@magic.itg.ti.com
Message-ID: <49ktaq$ge9@mksrv1.dseg.ti.com>
Source record: 209686

I have an Astron RS-35M that I bought new in 1983. It has given me excellent service. The only thing that has needed repair was the on/off rocker switch, which went bad and would not turn off. I replaced it with a newer computer-grade switch and there have been no more problems. Astron quit using the old style switch many years ago, so this would no longer be a problem at all. The regulation is excellent from no load to full load. I have made one modification: I added a pair of 5-way binding posts to the front panel to supplement the 1/4-20 bolts on the back panel for power output. This enables me to plug in low-current equipment and test leads. Other than that, I have no plans to change it.

I have never heard anyone complain about an Astron...

Despite the fact that some transceivers are approaching the 10K mark, Amateur Radio is one of the least expensive hobbies I know. $1,000 buys much more than it did thrity years ago, and the used market is glutted with reliable and inexpensive equipment. This is also one of the few hobbies I've ever been involved with where the participants could manufacture their own equipment and not be "shut out".

Can you imnagine casting an engine block for a weekend race car, or laminating your own fiberglass for skis, or fabricating a 35mm homebrew camera? If the stuff worked at all, you'd be lucky.

My first ham station (1966) cost about $140.00. Today, I could duplicate it for even less. Of all the things that may be legitimately wrong with this hobby, cost just isn't one of them.

From: hillgen@remus.rutgers.edu
Message-ID: <49l7td$eh2@remus.rutgers.edu>
Source record: 209690

I recently picked up a very hefty power supply with the intent of using it
to power my amateur gear. It's a Trygon Electronics PS1. The meters go to
10 volts and 100 amps. If it put out even a fraction of that current, I would
be pleased. The problem is that I have only gotten it to produce 11 volts. I
believe that my equipment (a mix of solid state and tube) will operate
effictively from this power source, but I need some opinions before I try it.
Also, if anyone oth there has any experience with a supply of this type,
any information about getting it up neat 13.8V would be GREATLY appreciated!
Thanks,
jay

>is competitive.

I would be leery of any vertical which the marketing says 'no radials
required'. Efficiency is lost when verticals are mounted on or slightly
above ground. A proper radial system will reduce the ground losses
allowing better radiation from the antenna. Get a Butternut and put out
radials - That's what I did.

I have an old Robotics 1200 baud external modem.

Are there any uses I could put this to in conjunction with my
transceiver (IC706)??

Any published mods to uses standard PC modems with ham radios??

4810. Re: Yaesu FT-51R or Kenwood Th-79A (D) Pros & Cons?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-30 00:00:00 UTC
From: Mike Lubrecht <Lube@accessone.com>
Message-ID: <49kpn5$fi0@news.accessone.com>
Source record: 209718

I looked at both the Yaesu and the Kenwood recently myself, and then chose the Icom W31A. The dealer (who sold all three) as well as several friends and acquaintances gave the Icom unit the nod in terms of durability and reliability. I decided that the "on-line help" features were pretty much unneeded after the first couple weeks of operation, and the Icom has a full complement of features that might be used (code and tone squelch, etc.) It is also easy to modify for broad band receive.

For what it's worth!

Mike

4811. Re: TEN TEC SCOUT...GOTTA LOVE IT

Newsgroup: rec.radio.amateur.equipment

Source record: 209719

I had a used Scout for about a year (sold it recently to buy a new Alinco DX-70T for the mobile). The Scout performs very well, is simple to operate, and always got good reports on SSB and CW.

Some things the Scout did NOT have that would have been nice:
-- LCD instead of LEDs (lower power consumption)
-- RF gain control (some of us still use this feature!)
-- CW output power adjustable from front or rear panel, instead of having to fish a tweaker through a hole in the cabinet
-- sidetone volume that tracks the receiver volume (if you set it loud enough to be useful when operating with a speaker, you get your ears blasted when you switch to headphones; I built an adaptor cable with a 100 Ohm resistor in series to combat this problem)

All in all, the Scout is a good solid rig. I think it may be a bit overpriced, but it's selling like mad, so perhaps it's just me. By the time you buy the rig, all the band modules, a hand mic, mobile mount, and the noise blanker, you've spent over $800. For under $200 more, you can buy the Kenwood TS-50S or the Alinco DX-70T, which do a lot more than the Scout and have far better receivers. If you don't need all the bands, however, you can buy only what you need. A garden-variety electret hand mic works ok (don't have to buy the $49 Ten-Tec mic), and you can make your own mount. The NB works well, and is a must for mobiling. The Scout, as you can see, has its pluses and minuses.

Hope this helps.

Hi !

Has anybody experience on connecting Baypac Baycom Packet Radio modem to
handheld radio KENWOOD TH77 ?

In my case the equipment is receiving ok but it does not send.
The modem is keying the PTT and the carrier transmitted but the
modem can't maybe not modulate.

Is it question about too low level in the input from the modem Or what ?

If I am posting to the wrong group let me apologize in advance. Please direct me to a more appropriate location. THANKS

I am interested in locating a small lapel microphone to wear that transmits thru an FM frequency on my radio. I own an RV and when my wife & I travel we must speak very loud to have a "normal" conversation. In adition, when backing into a trailer location it is helpful to have more than hand signal assistance from the rear.

I have tried Best Buy and local discount stores. No luck.

4830. receive overload on ts-520s

Newsgroup: rec.radio.amateur.equipment
Date: 1995-11-30 00:00:00 UTC
From: tomas@ra.cgd.ucar.edu
Message-ID: <49kkeh$qra@ncar.ucar.edu>
Source record: 209738

Hello all,

I have an old ts-520s and live in a neighborhood in which several other
amateurs operate. Unfortunately, the ts-520s receiver doesn't like
it when there are strong signals present on the band it is tuned to.
It gets mad and the agc kicks in with a vengeance---even if the strong
signal is several 100 kHz away.

I've tried using the attenuator button (20 db); not surprisingly, this helps
a little. I've also tried turning of the noise blanker (thanks to the reader
who provided the suggestion); not sure if this helps or not yet. The less
than acceptable solution I've found is to disable the agc when it starts
throwing a tantrum. I am in search of suggestions/answers:

1) Is this a well known problem with these old rigs?
2) Is there a mod that will/may help?
3) If my poor uncle were to leave me several hundred dollars, are there used
rigs out there that deal with strong signals better?
4) If my rich aunt were to leave me several thousand dollars, are there new
rigs out there that deal with strong signals better?

By the way, I operate cw almost exclusively (as do my neighbors) and the
rig does not have the cw filter installed.

I picked up one of these transceivers (I think it is an E model). It didn't come with a manual or a power cord. It seems like it should come with a connector with about 16 or so connections. If anyone has this connector, I would like to get an idea of the drawing for it so that I can reproduce the cable. I would also like to get a copy of the manual. If anyone can give me some help here let me know.

thanks

Hello,

I am looking for 23cms gear-either an FM handheld or, better still, a transverter with (preferably) an IF of 144MHz. These seem to be just about unobtainable in the UK so I would definitely consider obtaining gear from the US-post paid of course! I am aware that there is a fine transverter available from DownEast as a kit but being lazy I would rather buy one! I must point out that I am a cheapskate, so the cheaper the better........

If you have anything you wish to sell matching the above descriptions then Email me at: al@boltons.demon.co.uk

Many thanks,

Al Bolton.

The Icom IC-3SAT handheld, which I have recently gotten through this net, did not come with the UT-49 Touch-Tone (DTMF) code-squelch/paging board. I will need that board to help ham communications with my soon-to-be-licensed wife.

If you have a working UT-49 available, please e-mail me the details. It doesn't matter to me whether your board was purchased and never used, or used but removed and saved when the set in which it was installed was sold.

In any case, I will be looking forward to e-mail from any of you who can help.

Thank you very much.
Steve N7AJP/Phoenix 2wsk000@gc.maricopa.edu

P.S. I have for sale or trade a spare UT-51 sub-audible tone-encoder board.

When I went looking for a power supply several years ago, I was told that
Astron makes the Kenwood power supplies. When my RS-35A took a lightning
hit a few years back, I had to replace the zener diode, and the LM-723 to
get it back up. For my purposes, I prefer a linear suply controlled by a
723. They are very easy to repair, and I have had no equipment problems.

Thought it was sold, but buyer couldn't get XYL's approval, so available again. TS940S/AT. Unit is a 7mil serial number,
very clean, single owner, non-smoker. Have original box, manual, etc. As previous 'buyer' didn't want the dual CW filters,
(YG455C-1 & YK88C-1) I removed them. Will sell rig with or without filters - $1,295 with/$1,150 without. (filters only for sale
after rig is gone!) Perfer buyer picks up so you're able to see and admire first, but can package.
Buyer pays UPS shipping/insurance/COD fee.
Works smooth as silk with the TL922A also listed! This is a great Christmas present to yourself!

>73,Gary, KJ6Q

OTOH Gary, how much did a computer cost in those days? Or a video tape recorder? Ham gear *should* be a lot cheaper today than it was back then. And it should be cheaper still. Yes, the displays are still fairly pricey as well as the final transistors, but these companies are making some very handsome profits in this business.

Bottom line is, pricing is adjusted to what the market will bear (not just to the cost of producing an item). The Icom 706 is a good example of what can be done. That radio lists for $400 less than their 275h 2 meter all-mode!

The original post had it right. But as long as there are hams around that will pay just about any price for their new radio, the prices will stay up.

Chuck, The Yaesu 51 is a nice "little" radio, perfect for carrying
around town in a pocket or purse. I would recommend the Yaesu 530
over both of the above models thou. The 530 is a full featured radio
with a real battery pack. Check them both out.

Gawd, if you have to ask about this, I would suggest getting
someone else to maintain the rptr!!!

Seriously, if you rptr is hearing .25 or so on 2mtrs, DONT PUT A
PREAMP on it!!!! LEAVE THE PREAMP OFF!!!!! You will only end up
with intermod and/or desense in the rptr.....

The DUPLEXER is the LAST/FIRST thing from/to the antenna
feedline. NOTHING should go on the antenna side of the duplexers
except the ANTENNA!

Thought you might like to know that I have used an American purchased C508A in the UK on 2m. It works great because it has the 1750Hz call feature. The only problem is that the 440MHz coverage cuts off above the UK band. There is a mod for extended transmit range, that I hope to do before my next trip to Scotland.

By the way, the front end is very intermod prone with an external antenna, especially on 2m. The antenna supplied seems to be so narrow in bandwidth that is effectively used to reduce intermod to acceptable levels.

Apart from that it is a great HT - the 250mW works into most repeaters for about a 40 mile radius with an external mag mount, about 20 miles with the supplied antenna. Everyone who has seen mine has gone out and bought one

The battery is listed as a 3 Volt 170mah Lithium, Ranger part number is EX08N41405... The best fix is to buy a small dual cell AAA holder at your local Radio Shack. Then mount this against the left, rear, chassis side.(Near the Final Amp stage) Wire these two AAA batteries in series to the old posts where the original Lithium cell was. I tend to put in a couple of duracells. This will work for years before you'll need to worry about them again.

Part of the problem with new hams complaining that ham gear is too expensive is their misconception that only something brand spanking new and loaded with features will allow them to make contacts with other hams. This is so far from the truth, it's insane! Sure, on today's crowded HF bands, one of the newer rigs with DSP, loads of filtering, etc, will make it easier for a contester, DXer, or anyone who experiences a lot of noise and QRN. However... the older gear, available at a fraction of the cost of newer stuff, will still work fine, especially for the casual user or the beginner. On VHF FM, working through the local repeater, an old crystal rig will work just as well as a new full-featured rig. All of the bells and whistles are neat to brag about, but do any of us really use most of them? My HT (an Alinco) has eight scanning modes! I never use any of them! 100 memories? Why? There aren't 100 repeaters to work! Many locales only have one or two! I think I'm probably "preaching to the congregation" here, so I'll step down off my soap box and politely beg your forgiveness.

But... if you ever have the opportunity to "elmer" a new ham, be sure to fill him/her in on the real-world facts about what kind of gear is out there.

The Astron supplies are simple brute force units consisting of a
heavy transformer, rectifier bridge, filter capacitor, and a simple
pass regulator. They are akin to an anvil, simple, brutish, and
reliable. They're nearly idiot proof.

I don't know the internals of the Diawa, but from your description
I would suspect it is a switching supply. Now switchers are modern,
light, compact, and likely to be sources of RFI and be affected by
RFI. They can also be the very devil to troubleshoot, can be very
sensitive to minimum loading, and otherwise a pain in the ass.

Switchers are generally more efficient than linear supplies, and
can be cheaper as well. *If* they are designed properly for the
intended service, they can be very good choices. If, OTOH, you want
a good general purpose supply and don't really care much about
efficiency or mass, the linear supply is a much better choice.

Hi Jim,

It says it right on the box of the TM-241a...I had bought one around last spring that says Japan and bought another in the summer that says made in China...they switched around then..I bought mine at HRO in DE. They also made an unannounced CPU change then which made all the mod listings invalid..As far as what part of it, or even how much of it I don't know, but guess you can call Kenwood.. even so parts are made all over the world and nothing much is made in the US anymore...I have had chinese electronics before and have always had to figure on doing resoldering after oxidation sets in.. besides half hour after getting a chinese radio I feel like getting another one..(sorry, old Chinese food joke)..

I haven't come across a schematic yet, but the power transformer has got to take up about half of the supply's weight (approx 75-100lbs) so I assume it has a bit of muscle.

>
>Gary WB8POK

Yes, of course sales volume is an important factor. The volume of
sales today you'll have to admit is much better than it was in the
50's and 60's! So there is more money to be made.

If each of those 6000 radios from your example cost $200 to make (which I
suspect could be the case), the total cost for 6000 units would then be
$1.2 million. If they _do_ receive a $2.8 million profit,.... well a
profit of 133% is usually considered a pretty good return on investment.
While this this profit margin is exaggerated, there is still plenty of
money to be made manufacturing amateur radios - otherwise rest assured
no one would do it.

Perhaps the truth lies somewhere between the extreme points of view -
that amateur radios are neither exorbitantly overpriced, nor are they
priced as reasonably as they could be.

Has anyone successfully used the memory keyer in the 1000MP??

I wrote an experimental program on the computer that let the function keys serve as the buttons for the keyer.

I could store a couple of characters in each memory but that's all. Not nearly what the manual said was possible. I could get nothing out of the serial number memory.

Is this a bug or is something wrong with mine??

From: James Garland <garland@ohstpy.mps.ohio-state.edu>
Message-ID: <49nes5$i2b@pacific.mps.ohio-state.edu>
Source record: 209520

There are several possibilities for getting more output voltage from the supply, all of which will be easier to implement if you have a circuit diagram.

I am assuming the power supply (10V@100A) uses series regulation and is not a switching supply. You should first check the unregulated voltage, which you can measure at the filter capacitor's "+" terminal. I'm guessing that the filter caps (one or more) are probably the large can type, rated at 10,000-20,000 uF and 50WVDC (approximately). If the unregulated voltage is greater than 15V under load, then you have enough headroom to increase the regulated output to at least 12 Volts.

Next you need to change the reference voltage used by the series regulation circuit. Sometimes this is as easy as turning an internal adjustment, or changing the resistor in a voltage divider. More likely, you'll need to change a reference zener diode. Increasing its voltage by two volts (e.g. from 6V to 8V) should suffice, and will result in a higher range of regulated output. You might not be able to get the full 100A from the supply with this change, but the supply should regulate up to at least 70 amps or so before dropping out of regulation. If things are borderline, try increasing the value of the filter capacitor to reduce ripple on the unregulated voltage.

If the unregulated voltage isn't great enough, then check to see if the power supply uses a full wave rectifier, with grounded xfmr centertap. If it does, then you can lift the centertap, and replace the full wave rectifiers with a bridge circuit. This change will double the unregulated voltage and will give you plenty of headroom. Be sure and check the voltage ratings of the filter caps, however, and replace them if there isn't enough headroom. You won't be able to draw the full 100Amps from the supply, but that shouldn't pose much of a problem.

An alternate possiblity, if the above modification doesn't seem workable, is to remove the transformer and add several turns to secondary. Use wire whose diameter is the same (approximately) of the secondary wire, which is probably humungous.

When you're all done, you'll need to pad the voltmeter and relable the scale so it will read a higher voltage than ten volts. Good luck.

>Not to forget Lambda. Very rugged, and they're backed by the company
>until the end of time.

If only that were true. Harris chose Lambda switching supplies for the solid state driver stages of its 100TH transmitter. There are six Lambda supplies in there. On average, we have had two in transit to or from Lambda for repair since we've had the transmitter. Lambda finally said that they wouldn't support the supply anymore. We then started trying to repair them ourselves. They have about 10 times as much circuitry in them as any sane designer would use, most of it protective in nature, and all of it feeding back on itself. They are very difficult to troubleshoot. We finally said "screw it" and just use diesel truck batteries on a float charger to power the solid state amps. We check the water once a month, and rotate in new batteries every couple of years. No more problems.

At one time, I used a 20A Lambda supply for my repeater. If there was a thunderstorm within 20 miles, the Lambda would go into protect and wouldn't come back out until I journeyed to the site, removed AC power and restored it. That was somewhat annoying considering the repeater is located 970 feet up a TV tower. So I just took my handy dikes and removed about 9/10ths of the circuitry in the Lambda, and now it is quite reliable. This Lambda *is* a linear supply rather than a switcher, but it is *grossly* overprotected (or at least it was), now it's about like an Astron.

In rec.radio.amateur.equipment you write:

>Anybody actually used a TS-870S? I would be very interested in what
>you think of it. I know that DSP works great in the output and I would
>think it should be nothing short of fabulous in the IF stage. Any
>comments from someone with actual hands on experience would be much
>appreciated.

Hi Jim:

I used the 870 up at HRO for an hour on 20 meters with the 850
next to it (with a DSP 9+ attached). Keep in mind that the 850
costs 1500 and the 870 costs about 2600. This was important to me.

I like the 870. The "new" display of digital width is exactly what
the 940 had, and it is neat. The digital width is nice, pretty sharp,
but it did not ever make the difference between copy on the 870
and no copy on the 850. The 850 with its IF filters switched in
seemed as good. The noise reduction in the 870 is nice, but not
a big difference over the DSP 9. I noticed that you cannot use more
than one function of the 870 DSP at once, while on the DSP 9
you can. I could not find a situation where the DSP actually
made a noisey signal copiable where it was otherwise not copiable,
but it did decrease ear "fatigue" especially on moderate signals.

As far as the "IF" stage DSP, I am intrigued by it, and I like it,
but it has its disadvantages. (First note that it is CHEAPER for
Kenwood to put into the rig than a full complement of quality
crystal IF filters) The DSP is at a stage way down the IF chain.
I believe that they have some IF filtering in the higher IF
stages, and this is good. However, the closer you get the tight
filtering to the "first" stage the better. This is where a lot
of overload, IMD, and noise becomes problematic. The sooner you
filter out the junk, the better. The 870 puts the main filter
at the last stage before AF (well, it is close to AF, but I
believe it is inside the AGC loop?) This is OK, but not optimal
from a receiver design standpoint.

Now, the cost question got to me. The 870 is a lot more expensive.
If you equip the 850 with a bunch of good filters, like IRCI,
I suspect it will perform as well, but not as fancy :-). The
IRCI filters add another $300+ to the 850 (2 CW, 2 SSB), cheaper
if used. So I compare the well equipped 850 at 1800 to the 870
at 2600 and I do not want to pay 800 more for what I seem to get.

That is my humble opinion, and I do mean humble. I presently use a Ten Tec OMNI VI and some homebrew stuff... I have been more intrigued by the Yaesu 1000MP since it offers a very good selection of IF filters in addition to the DSP at the end. I don't think you would go wrong with the 870 though, really. It is just that for my own money, I don't see the added value.

Sigh.. More technical help needed. But, first of all, thanks to all who reponded to my repeater / amp / pre-amp situation. A few days of fiddling and testing and all is coming together. Thanks from the entire club.

This posting (cry for help) is for my personal techie problems. Situation: Alinco DR 610 dual band (2m/70cm) rig. Has built in duplexer.....only one antenna lead out of back. RF Concepts (model 2-417) two meter amplifier. Daiwa vhf/uhf crossneedle meter between amp and dual band antenna.

On 2m everything works *exactly* as it should. On uhf/440 the amp will not pass any uhf signal. (With the amp neither off nor on.) Seems that the amp would simply pass the signal on through but instead just soaks it up. No 'readable' power passes through the amp at all.

So.....thinking all I need is a simple external duplexer to bypass the amp I promptly rob a Comet model 4160 uhf/vhf duplexer from another setup. Through a maze of adaptors and jumpers I run the single lead from the radio into the duplexer. Run the vhf out of the duplexer into the amp. Run the uhf out of the duplexer bypassing the amp and into one side of a ' T ' adaptor on the back of the meter. Run the vhf out of the amp into the other side of the 'T' adaptor on the back of the meter.

Thinking I've solved it all, I smugly switch everything on and cautiously begin to test. Well, duplexer does split the signal and I get a slight reading on the meter on both vhf and uhf now, but barely a reading. The maze of the jumpers and adaptors (or something) is soaking up all power, whether vhf through the amp or uhf bypassing the amp.

Simply put, I'm stumped and tired. Been dabbling with this for hours. Time to swallow my pride and post it to the group. Hamfest coming up tomorrow (Sat.) so any answers prior to then will help me gather any thing I may need to pick up.

Thanks to all. Any ham who doesn't access these groups are really missing out.

Generally, a flashing display means the PLL is unlocked. Your radio needs service.

>Steve Miller
>millersg@dmapub.dma.org
>WD8IXE - Ridin' the aethereal waves
Steve I would differ with you on this. Generally what you say is true, but as one raises the feedpoint of a vertical it becomes more effecient. Granted a common-garden-variety type vertical like my real old 14 AVQ shouldn't be used without radials but some verticals are designed with an elevated feedpoint so as to do away with radials. The ideal case in point would be a dipole, made half wave length, tilted on its side. One would NOT want to put radials on such an antenna. The gap works on the elevated feedpoint principle. Read some of the stuff Kurt N Sterba says in WorldRadio about this.
Anybody see any holes in what I say here?
Peace

4883. Kenwood TM-732 Microphone

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-01 00:00:00 UTC
From: larryka@wam.umd.edu
Message-ID: <49nb5u$t75@cville-srv.wam.umd.edu>
Source record: 209535

Has anyone had trouble with the microphone that comes with the TM-732A?
I've noticed that if I hold the mic for a while, the functions on the keypad stop working. It won't let me remotely control the functions of the radio. When the mic cools off, it works again. It seems like it's heat related.
I'm also wondering if anyone has had trouble with the clip on the connector. Mine broke off a couple days ago, after about two years. It looks like I'm either going to have to splice on a new connector, or buy a new mic. Any suggestions?

It doesn't use AM on 118-136. It's all FM-narrow. It sure would have
been nice if they thought about that one a little harder. It's a good
radio otherwise.

>And it should be cheaper still. Yes, the displays are still fairly pricey
>as well as the final transistors, but these companies are making some very
>handsome profits in this business.

look at the volume of VTR sales versus the potential sales of any ham gear.
if we assume there's only 1/2 of the possible operators actually active, then you
have only around 400k people to sell to. a far smaller group than the number of
people to buy computers (or even just computer applications...such as cars) or
VTRs.

for grins, go look at a late model betamax like an SLHF-900 or really go back to
the first popular VHS unit, the RCA VBT-200. look at the amount of metal and
work needed to make those things even work.

look at the modern VTR with it's bells and whistles. probably weighs 1/5 to 1/8
the VBT-200, all plastic - maybe not even repairable due to inability to get the
tolerances right if it's ever taken apart.

part of the big price reduction on things like VTRs is volume plus value engineering
that has cheapened up the designs to minimum parts required. if they're such a
deal, you'd see the production folks using 'em...but last time i saw a studio they
had the heavy stuff that was also designed for their function, but comes with at
least a 5x increase in price.

we're lucky we have the manufacturers we have given the stagnation in amateur
radio in the 70/80's....

That's the correct procedure, to do it yourself. Executives and
workers in China are routinely beaten and executed for their failure
to produce acceptable quality goods. It's far better not to let their
employer (govt/military) know you had a problem.

Speaking of Astrons and lightning hits, my RS-35A was powering an IC-28H whose antenna took a direct strike (AEA Isopole confetti all over the lawn). The 9913 was melted and there was a *huge* scorch mark on the top of the Astron cabinet (the IC-28H was sitting on it). When I opened up the Astron, the only damage was the *totally missing* MOVs on the AC line, and the *open* 0.01 ohm emitter ballast resistors for the pass transistors. Everything else was fine. I put in new resistors and new MOVs, and the supply came right back up (so did the radio believe it or not). Unfortunately, the TNC connected to the radio was silicon scrap, as was the computer connected to the TNC, and the monitor, printer, and phone modem connected to the computer. The 2000VA UPS was in *flames*. (Thus started my crusade to make sure amateur stations are properly protected against lightning, I knew better, but like the cobbler's kids, my station was barefoot in the lightning protection department before that strike.)

Hallo

a friend has got a Philips VHF power tube YD1303 and he would
like to have some data sheet or hints where to find further information.
This tube was possibly intended for a PLISCH TV transmitter with
a few hundred watts at 400MHz.

Further informations would be appreciated very much.

This discussion reminds me of a story my grandfather told me...

His brother in law lamented that ice cream cones were so expensive nowadays and that when he was a kid they were only a nickle.

My grandfather replied, "I couldn't afford one back then, now I can buy as many as I want."

Granted one can't buy as many TS-950's as they want, but I think the same philosophy holds true. Income over the long term has risen faster than the price of goods.

I have the HTX-212. I find it to be a very good radio, the audio is VERY good. Has most of the features you would want in a mobile. Just a few inconveniances such as not being able to store non-ham frequencies in memory, and it's not easy sending DTMF tones. The CAP/MARS expansion is only 1MHz below and above. But that's not why I bought it. Go to an authorized dealer and you should be able to get for 20-30% less. Also good for packet operation. I'm not ashamed to use it, but then again I only drive a Toyota, not a BMW.

I have a couple Astrons at home and a couple more I use at work and have had few problems.

HOWEVER:

The company I work for has about 70 stores and for years we used the Astrons to power the electronics display. I had to repair some that had overheated the connections on the pcb. I fixed them by installing heavy wire jumpers. Mind you these are running at about 75% of ca pacity 7 days a week and about 12 hours per day. Recently we had to change to another make because the Astrons are not UL approved. The Fire Marshalls in some states would not let us open the stores until we replaced them with UL approved units which cost us over $300 each in quantity! If your house ever burns down the non-Ul approved Astrons may be a problem for you.

>Jim Kelley
>KE6JPO

I suspect the reason that ham gear is relatively expensive is because
it's such a limited market. How many hams are there in the US for
example ??? 5 or 6 hundred thousand ??
Say there are 600k and that 1 out of a hundred bought that 275H 2 ,2
meter all-mode in 1995 (probably much higher than the real number of
US buyers) , that's 6000 purchases of say a $1800.00 radio which
equals about 11 million dollars in sales. Let's say gross profit is a
whopping 50% of sales, that's about 5 and a half million dollars and
then let's say that net profit is a whopping 50% of gross profit,
that's about 2.8 million dollars, for the US, a (the ?) major ham
market.

That's a lot of $$$ for me, but certainly not a lot of money for a manufacturer. (Actually Icom might be thrilled if 1 out of 100 hams bought their new IC-706 in 1996.

That's just ballpark accounting and I'm sure someone could sharpen up my numbers but I doubt that the manufacturers are exactly lighting cigars with $100.00 bills (YEN), they just don't have the potential 200 million or so households to spread their costs over like they would if they were making TV's, VCR's Microwaves etc.

BTW I just sold my TS-850 because I didn't like having that much money tied up in something that didn't get used much. :-)

I'll vote for that. Steve's experience parallels mine. The best verticals I've used employed radial systems, one is the Butternut, and one is a MFJ full size quarter wave (35 ft tall) on 40 and 20 and top loaded on 80. Both systems murder a GAP and an R7.

That 10V meter probably indicates that the supply was intended to
output somthing between 6-8V. Raising that to 13.8V is a big
increase and the power transformer may simply not put out enough.

Do you have a schematic?

SW radio is regulated CB is not. usually CB does not bend over the horizon.
To use SW radio you need an amateur licence...

>
> Does anyone know how possible, leagal and/or expencive is this project?
>
possible, yes. If you've got the licence it's even legal, but still then not
appiciated by other ham's. If you are using CB you'll find the chanels to small
(close together) to use 28k8, common practice on CB is 1k2 or 2k4. This
is due to the bandwith required to transmit 28k8 over loger distances
while leaving some s/n ratio at the receiving end.
1k2 is not expencive, a few bugs for the modem is all you need to spend.
If you're willing to learn for the licence, the ham-radio packet-network
might come close to your needs.

If you want to know more about hams just ask an american ham. Maybe you
should reed rec.radio.amateur.digital.misc for a while.

Hello all.

I am interested in an interesting idea that I have for my computer:

I want to connect the computer to another one over the radio waves.
I need it to be running 24 hrs a day 7 days a week. It has to broadcast
over about a 60 mile range. And have a speed of about a 28.8 modem.

Preferably I would want a full-duplex connection just hooked up to
modems on both sides. But other similar ideas I want to consider for
myself too.

I live in the US, and in fact I want to transmit from the east cost of New
Jersey to Long Island NY.

I thought that maybe SW radio would be good, since it's a. not regulated,
and b. can bend over the horizon.

Does anyone know how possible, leagal and/or expencive is this project?

(e-mail is prefferable)

Transmitting data over HF radio is done all the time by agencies in Aviation, Military, Maritime and Commercial. Basically the problem has to do with both regulation and bandwidth. First, the HF bands are highly regulated and you would have to get the FCC to assign you a channel, or you could become an amateur radio operator and use one of the many data frequencies available to them.

Next, the typical transmission rate on HF is less than 1200 baud. The fastest commercially available modem I am aware of is made by HAL electronics and using a special modulation scheme called CLOVER, they can attain a rate of 4800 baud, theoretically. But given propogation conditions it is usually much slower than this.

Because HF frequencies are assigned to many users internationally, what may appear to be a non-congested spectrum is actually quite busy. Therefore the channel bandwidth is narrow, giving everyone a chance to get on the air, but because of this the transmission rate for digital data is very slow, often 100 baud or less.

I would recommend that in order to get up to speed on the latest technology and to try out some ideas that you first contact the local amateur radio club and see what they are doing.

Craig

4918. Transceiver Testing ?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-02 00:00:00 UTC
From: jalil@pop.jaring.my
Message-ID: <49osks$92c_006@kl2.jaring.my>
Source record: 209362

Does anyone have a test procedure for transceiver ?
I mean especially on the receiver side for sensitivity, selectivity, IM, sinad and what have you.

I've lost my documentation which was an old HP training manual when i moved, and to date, i still cannot find a decent radio test paper. Is it some kind of big deal secret now or is it people don't test radios anymore ?

Please post here as i'm pretty sure there would be many others interested in the same.

Many Thanks.

I sold computers at a local dealership for about a year.
We also built custom computers as well. I was hired because
I had experience building computers from scratch. In March
of '95 we picked up the PB Line and man was I amazed. We
discovered that PB was putting very slow hard drives, very
slow video cards, and other parts that were not what I would
call "current". Our 486 DX2-66 computers would exceed the
performance of PB's Pentium systems up to 75 Mhz. We also
built 486 DX4 80 & 100 systems that blew the socks off PB's
Pentium 90 & 100 systems. What gives??? Their poor
supporting hardware (HDD, HDD controller, Video controller)
seems to bottleneck what is otherwise a fantastic processor.
As far as service was concerned, when someone had a problem,
we simply exchanged the computer for up to 1 year!! We were
the #1 PB dealer in the area so we could easily make PB eat
it or drop their line!

My suggestion to computer buyers is to build your own!! If
you don't know how, find someone that does. You can then
hand pick each piece that goes into it and get a good
performance machine. Another rule of thumb I use is to NEVER
buy a computer based on the software packaged with it. It is
only a sales gimmick!

Price wise custom built computers run a little higher but the
performance advantage is worth it in the future. And by
hand picking good, brand-name parts, you'll have less service
problems.

btw...we commonly referred to the PB as our best POS (Piece of
$hit) computers!

Forget it. Use phone lines for that kind of speed. Only microwaves allow
that kind of bandwidth!

>73,
>
>Jack WB3U

Jack, Well Said....During this year's CQWW CQ contest, I could tell exactly which stations were using an Icom rig in full breakin with an amplifier. Every JA's first call was chopped and therefore copied as OA. The QSK and t/r startup are so slow in their rigs it chopped off the entire first dit. Ten Tec had it pretty well ironed out, Yaesu was getting closer in the 890/990/1000 series rigs, but ICOM _still_ cant get the blasted QSK correct. I had a 751A and that was the only real complaint....QSK stunk above 35 WPM and became very "choppy" with about 1.7:1 dash/dot ratio or less. My old Harvey Wells Transmitter and Drake r4b with dow-key relays worked better than these fancy new rigs. Oh well..offa the soapbox now.

Paul_N_Nix@aud.alcatel.com says...
>
>Can someone confirm the name of a Japanese CW key
>manufacturer as "Hi-Mound"?
>

Yes, this is correct. They make an entire line of CW straight keys,
paddles, electronic, and reed-relay keyers. They are popular in JA
and are easy to get ahold of (like a Bencher or Vibroplex in the USA).
Any JA ham magazine will usually have 1 add for the Hi-Mound paddles.

I dont have model numbers here, but I lived in Japan for about 3 years (Tokyo)
and have lots of ham buddies still up there. We chat daily too, so no
problem if you need some info.

As for products, I was impressed with their top-of-the-line keyer/paddle
combination. It is relay driven (you can hear the little relay inside the
unit clicking away), not transistor switched. The base is made of white
marble and chrome (very _heavy_ base) and the keyer/paddle are 1 single
unit like the old Heathkit keyer. The paddles themself are made from clear
plastic that has a polished beveled edge. The paddles are also very closely
spaced together (like a side-swiper), so finger travel is minimal. Cost is
about JPY 20,000 or about US$ 200 bucks. This was about 8 months ago before
moving down to BV2-land.

Happy CWing or CW collecting!

>I believe that, in the last 2 or 3 years, one of
>the U.S. ham magazines mentioned that there's a
>ham who's importing them into the U.S. Can someone
>provide that information? (maybe a K8 ?)

Sorry, cant help. I think the K8 is importing the Kent or G4ZPY
paddles from the United Kingdome. Perhaps it's the same guy.

I have 2 HF rigs and was curious how others inter connect 2 HF radios for dual receive in contest operation. What do you do to prevent damage to one or the other radios. I want to use the same antenna for both. I can split receive audio out from the icom 761 thru the external jummper on the back. What slick ideas have some of you come up with?

UL means "unlock," and indicates that the phase-locked loop is unable to lock. It is NOT a microprocessor problem. You can reset it all day long, and it won't help. Usually, it's a problem with a tuned circuit the PLL is unable to bring to proper frequency, but it could be something else. Unfortunately, Azdens seem to have this kind of trouble very often. You need to send it in for service- it takes a pretty skilled tech to fix problems like that. Good luck, I hope it works out.

>Peace
>WB0FDJ

Hi Mr. WB0FDJ,

I disagree with that. Contrary to what Mr. "Sterba" thinks, he does make errors. Let me explain the flaw in the theory he supported.

Feedpoint location is not directly related to efficiency. Major changes in efficiency, in an antenna of given length and conductor loss, come from changes in current distribution and level.

We know antennas radiate the strongest EM field from the current maxima, but they also radiate from any area that has current flow. That radiation causes electrons to flow in any conductor in the area of the antenna (and even throughout the universe)! The only thing that stops the efect is shieding or cancellation by having an exactly equal and opposite "movement".

Let's look at the GAP. The hype is that the "elevated gap radiates, and keeps the radiation far above the earth". The gap doesn't radiate, the current displacement does. A base fed half wave vertical has a gap at the base, yet it radiates primarily from the center! A pair of stacked 1/2 waves called "two half waves in phase" has a gap in the middle, but the main radiated field comes from the unbroken center of each half!

The current maxima of the GAP isn't even at the feedpoint (gap), because it is an asymetrical vertical. And ground losses are identical to what they would be if the conductor was broken and fed ANYWHERE in the structure! It's all hype. (Instead of a lightning bolt leaping from the "gap" it should be a little tiny spark. ;-))

For a given vertical radiator length under 1/2 wl, maximum efficiency always occurs if the radiator is worked against a good ground system. Especially if the current is as large as possible over the entire length of the radiating structure. That's why the Uni-hat blew the GASH away in a test with real FS meters, and why a ground mounted vertical with a modest radial system got much better reports in QST's review. My ground mounted MFJ quarter wave and a Butternut with radials both killed a GAP here (I've done the A-B tests). They even mis-apply an IEEE paper about an asymetrical BC band vertical 1/2 wl tall that was fed against six full length radials 1/4 wl above earth at the feedpoint. That doesn't look anything like the GAP, yet they quote the conclusion of that veryticals performance in their ads! Hype, hype, hype.

If you can't have radials, and need a vertical, use a groundless vertical. It'll get you on the air. If you can put in a modest ground, use a regular vertical. You'll be much louder. That goes for ALL groundless verticals, not just the Gash.

I agree fully with Steve Miller. Ole "Kurt" is in orbit on this one.

:
: I just purchased a TM-241A and haven't heard anything on the aircraft band
: yet. I was just wondering how it knows to use AM for the 118-136 freq and
: FM for the 144-148 freqs. I don't see any info in the users manual on this.

As Robert says, the sensitivity in the aircraft band is pathetic. To verify that your thing is working, ask a pilot who lives near you for the center frequencies, and maybe try unicom (122.7, 122.8, 123.0) for nearby uncontrolled airports.

I love my 241A but airplanes 15 miles away in the pattern are barely audible. I guess there's some tradeoff between sensitivity and selectivity in the ham band; I'll take the latter.

My only real complaint about the 241A's AM performance is the large difference in squelch and volume calibration between AM and FM. That problem could have easily been solved without sacrificing selectivity, but it wasnt...

Assuming you are talking about a modern rig (not an older FT-208R or something else with a weird connector), you can easily make one yourself from Radio Shack parts. I've made several. All you do is buy the two plugs (both are standard items), plug them in, then use a little masking tape to hold them in their relative positions. Now, remove them from the radio and hot-melt glue around them to keep them properly separated. It might take you a couple of tries to get the hang of it, but you can do it. It doesn't look pretty, but it works. Good luck.

4944. Kenwood TS-850 SAT New Pricing

Many of you have been asking about accessories for the Kenwood TS-850SAT that I have for sale. So, I am going to price the package of the TS-850 with auto antenna tuner, 500 hz filter for the first IF, 500 hz filter for the 2nd IF, 270 hz filter for the first IF (these filters can be cascaded), the MC-80 microphone, SP-31 external speaker with audio filters, boxes, manuals and power cord.

After calling a major ham dealer I found the pricing for this rig would be $1,400 with one cw filter. The other accessories would total $470. Total package would be $1,870.

My price for the package is $1,600.

>1) Is this a well known problem with these old rigs?

Yikes! Your 520 may be better than the NEW rigs! It is a well known
problem with ANY rig when you are that close to another strong station.
The only rigs I know that really handle it well is the Drake lines
and Collins rigs. My Ten Tec OMNI is pretty darned good, but not as
good as the old rigs at it.

>2) Is there a mod that will/may help?

There may be nothing you can do to eliminate it completely depending
on the proximity and power those stations are putting out. However,
you can try several things to reduce it. The ATT and NB suggestions
are good ones.

DO you use a very sharply peaked antenna tuner? This may help. Ask
around to find guys who use tuners that need readjustment every time
they move 25 kHz....that would be a good one. Then put it in line
and test it out. It might help.

Also, if you know where these other stations are, you can attempt to
put your antenna at right angles to them. I suspect this may give you
a few db.

>3) If my poor uncle were to leave me several hundred dollars, are there used
> rigs out there that deal with strong signals better?

The Drake C line is cost effective and works well. It just might
handle your problem. You would do well to find one with the "Sherwood
mods" as it is designed to handle just this situation.

>4) If my rich aunt were to leave me several thousand dollars, are there new
> rigs out there that deal with strong signals better?

Probably not, though many may disagree. Read the articles on receiver
design in the last few QST's for a good discussion about why.
There certainly are new ones that do relatively better than others
though. Go up the cost ladder and you generally get that. My
Ten Tec OMNI VI does very well for a newer rig.

>By the way, I operate cw almost exclusively (as do my neighbors) and the
>rig does not have the cw filter installed.

OH! Get a sharp filter right away! Try calling IRCI if you have the latest QST (they are in the classifieds, they sell filters) and get a good one. This may help a bunch, and is not expensive.

>button works.
>

I must preface the following by saying that I have not worked on a PCS-5000,
but have had extensive experience on the PCS-3000 and PCS-4000.

One of the most common problem with the earlier versions of your radio is
having the PLL unlock. There were 3 common causes for this problem, number
one of which was supposed to have been fixed with the late model '4000's.

1. The display was illuminated by two tiny 'grain-of-wheat' bulbs, each
designed for 6 Volts. These were put in series and powered directly from
the 12 V supply with no current limiting resistor. Now, you may wonder
"What the @#$@$ is this guy doing telling me about pilot lights for?"
The answer is that Azden, in their infinite wisdom/stupidity (circle one)
used this lamp circuit as a part of an RC timing circuit to properly
sequence the microprocessor for power-up and power-down. If either of
the bulbs blew out, not only did you lose the illumination of the control
buttons, but the microprocessor stood a good chance of not being able to
'boot' properly, thus leaving you in the unlocked and uncontrollable
condition described above.

The fix for this, besides replacing the defective lamp, is to put a
1K Ohm, 1/4 Watt resistor accross the TWO lamps in series. This is a
sufficiently low enough resistance to allow the micro to sequence, but
not adversely effect the lamps. This fix came from the techs at Amateur
Wholesale Electronics, Azden's US distributor.

2. The coil in the PLL compartment is wound with wire of an alloy which,
while it exhibits excellent temperature stability, accepts tinning very
poorly. This often results in a cold solder joint after about a year or
two, causing an open circuit in the voltage-controlled-oscillator which
results in unlocking the PLL. It has to unlock, there is no longer any
signal coming from the oscillator!

The fix for this is to de-solder this coil (only a few turns of approx.
20 GA wire) and very carefully tin it with a good quality 63/37 Tin/Lead

solder and a liquid rosin flux. I recommend Kester's Resin 44 (TM) Solder and a 40 - 60 watt iron. DO NOT use a GUN unless you remove the coil from the radio first!! Carefully tin the two ends and re-solder to the PC board. It also wouldn't hurt at this point to touch up the soldering on the rest of the components in the PLL compartment. After doing this, make sure there is still a very LIBERAL amount of Beeswax on the component side of the board in this compartment, otherwise you may introduce microphonic action. Observe fix number 3 below.

3. The two PC boards that make up the transmitter exciter and the receiver are mounted to the frame with a series of screws spread out over the perimeter and a few in the middle of the boards. Over time, especially when the radio is used in a mobile application, these screws loosen up, causing the radio to lose a critical ground connection. That's right, they depend on mounting screws to connect certain board traces to chassis ground! This can not only cause unlocking of the PLL, but also loss of power on transmit.

The fix here is simply to tighten the ALL of the screws used to mount the two boards and cover the heads with either a coating of Glypt or nail polish or lacquer. This will offer some protection against them loosening again as well as an indication if they have. Make sure to verify proper operation of the radio before putting the covers back on.

Again, I have no way of knowing if these problems were still present in the PCS-5000. I switched brands after the first two. :) However if your radio is constructed in the same way, two large circuit boards mounted solder side to solder side, and mounted to the extruded side rails, then some or all of the above may be your answer. Good luck and hope you can fix it.

4947. GE MPS Handheld Question

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-02 00:00:00 UTC
From: sidener@crunch.nuc.umr.edu
Message-ID: <49ps8c$hef@hptemp1.cc.umr.edu>
Source record: 209391

I currently have a GE MPS hand held radio. It looks like it would
handle 64 channels and tones, but other than that I don't know much about it.
I was wondering if anyone has had experience with these radios?
(136-174Mhz)
Are they any good?
How easy is it to program?
What can be programmed? (tone?) (offset?)

What is one worth?

(I may buy another because I have the mobile audio-amp-charger-speaker-PA combo.)

Please let me knpw what you think.

Thanks,

Scott Sidener N0WFL sidener@umr.edu

I asked ICOM about this and their out is " there's only a few high speed cw ops". Well fooey! Let me first say that the characters are shortened at ANY speed, slow or fast. It just sounds WORSE at higher speeds. The way a rig should work is, When I tell it to make a dot of X length, it should do so, not wait for X amount of time then produce a shorter dot. This is comparable to distortion on phone!

Icom, the word is out on this and many cw ops are flocking to buy TS-50's now instead of IC-706's. TS-50s are getting cheap on the used market now.

: >A few don't care for full break in as it does not
: >respond fast enough for those 35+ Wpm CW op's on full
: >break-in well.

: Full break-in CW isn't exactly rocket science. Why can't these guys
: get it right?

In rec.radio.amateur.equipment you write:

>I had a used Scout for about a year (sold it recently to buy a new
....
>Some things the Scout did NOT have that would have been nice:
....
>mic, mobile mount, and the noise blanker, you've spent over $800.
>For under $200 more, you can buy the Kenwood TS-50S or the Alinco
>DX-70T, which do a lot more than the Scout and have far better
>receivers. If you don't need all the bands, however, you can buy

Doesn't the variable filter work fairly well? That would mean you would need to include the price of a CW and SSB narrow filter in the Alinco and Kenwood prices to compare with the full band module Scout.

Now, the interesting question, what do you mean by "better receiver"? I am genuinely curious. I have used none of the receivers you list, so I can't tell myself. I only have the word of several users of the TS 50 who complain of overload. Maybe the Scout has the same problems? Lots of filter blow-by, too? I suppose that small boxes almost mandate the compromises that would result in these problems.

I really appreciate the comments. I am beginning to become very, very interested in receivers and their relative performance.

FreeWave Technologies makes a spread spectrum modem that, depending upon conditions, might be able to meet your needs. With clear line of sight we can transmit full duplex 115 KB data over 20 miles.
Under ideal conditions much greater range can be achieved (recently a customer of ours had a 90 mile link from Mt. Everest to
Kathmandu with a 5 watt amplifier on only 1 end). The product can also be used as a store and forward repeater. Therefore,
with a combination of directional antennas, good line of sight, and a repeater or two, our product can do the job. Please let
me know if you would like some more information.

From: gregp@primenet.com
Message-ID: <gregp-0212951524170001@ip204.msp.primenet.com>
Source record: 209395

I have a Swan 250C and a couple of the tubes get extremely hot. The audio is low and kind of muffled (one of the tubes that gets hot is the audio amp).

I've checked all the tubes and they're good. I replaced a resistor that had burned and broke in half. Checked for other stuff that has obviously gone bad. The heater voltages on those two tubes are what they should be.

Is anyone familiar with these things and can point me in the right direction?

Thanks...

Hello folks!

Can someone tell me a fair price for a TenTec Analog #570 (Century 21) 10-80MCW Xcvr? It also has a TenTec keyer and an old MFJ Tuner. I have the pooprtunity to buy this radio, and the seller and I would like to know what a fair price is. The radio is in excellent condition. He told me that he thought that the keyer was about $75 new and that the tuner was about $100.

Also, can anyone tell me if they have used one of these rigs and what their opinions are? I know that it's CW only. My son and I are just trying to get on the HF bands. It has 5khz (hope that I have my units correct) , 2.5 khz, and 1khz filters. Will they be good enough? Does a newer filter fit it and is it needed? I've been reading about 500 hz (?) filters.

Boy, thanks for helping a newbie!!

Either e-mail or post here. THANKS!

From: Scott Van Aartsen <svanaart@nwciowa.edu>
Message-ID: <49p2bs$45k@news.iastate.edu>
Source record: 209398

I can't believe I've resorted to this, but -- radio has interested me for a very long time, and it is one of my favorite hobbies, as well as at least part of my intended vocation. I just recently became KB0ULA, technician amateur radio operator. I've heard a couple of 2-meter repeaters in my area, on my scanner, and would sure like to try my new call letters out. I have no amateur gear as of yet, unless you count my scanner and "11-meter" (cb) rig. .... ..

Anyway, I would be very appreciative if anyone could point me in the way of a (very) cheap 2-meter rig. Right now, I'm not fussy if it's mobile, hand-held, base unit, or otherwise.

I am completing my college degree in communication studies, so soon, on top of not getting paid for my internship, my college loans will come due. A great time mentally to start out in ham radio, but not financially. Hope someone can help.

Also, if you could, please send any responses via e-mail, as I do not have access to my account at college very often to check news.

Thank you so much,

Scott Van Aartsen,
KB0ULA

4955. AZDEN PCS-5000 2 meter rig Phase Lock problem

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-02 00:00:00 UTC
From: Chuck Hanson <crhanson@pop.athenet.net>
Message-ID: <49o7pf$2ac@hermes.athenet.net>
Source record: 209399

I have a Azden PCS-5000 2 meter rig that has a problem with the phase lock circuit or something. When the rig is turned on the display shows "UL" and not the frequency of the programmed channel.

I have reset the microprocessor many times and nothing changes. The radio does nothing except show "UL" in the display. . .no receive, no RF power, no speaker noise. The buttons have no effect, just the power button works.

Have you every had a problem like this? Any constructive advise or ideas as to what might be causing the problem? The radio was working great and one day when I turned it on the "UL" showed up on the display and hasn't gone away. The radio is "to good" to toss out.

Thanks for any help :-)

>of any of the box makers making happy noises about doing it though.

I just received a datasheet from Hal describing the DSP4100 which appears
to be a standalone PCI-4000 which communicates with the host via RS-232.
The datasheet even claims the DSP4100 is particularly well suited for
use with lap-top terminals in a portable and/or field environment :-)
I wasn't able to get a price for amateur applications but the fellow
I spoke with said it had recently been introduced into 'other' services
and would probably be marketed into the amateur radio service sometime
soon. I expected pricing but didn't get it in the mailing but I would
expect it to be more expensive then the PCI-4000 due to the more elaborate
packaging.

I'm quite interested in investing in either Clover or Pactor myself to
put together a NVIS data link for use while in the field.

FREE PAGER FACT SHEET (Prices/Spec subject to change without notice)

FOR YOUR PROTECTION, WE ARE A PARTICIPANT IN THE BETTER BUSINESS BUREAU CUSTOMER SATISFACTION PROGRAM !!

- PAGER COST - FREE !!! (retail value is $ 75 to $ 85) Activation is required
at time of order.

- Basic service is just $9.95 per month, billed quarterly.

- No long term contracts or credit checks !

- Special Discount - Accounts who order 4 or more pagers receive a discounted
rate of just $8.95 per month !

- All pagers are NEW and carry a 1-Year Manufacture's limited warranty.

- Pagers are shipped with Black cases. Requests for color cases will be honored, subject to availability and additional cost.
- Minimum pager features include, but are not limited to the following:
Standard Features:

- Local telephone number to access pager
- Digital display PLUS 9 CUSTOM-PROGRAMMED (from your own phone) preformed (FOR ARES/RACES - Can include call-out & frequency info, etc.)
Alpha messages.
- 18 telephone number memory
- Each call is time stamped
- 4 Tones and silent/vibrate mode select switch
- Basic service covers a radius of approximately 250 miles

Optional Features:

- 800 telephone number access
- Voice Mail
- Dual Area Code telephone access (Same Pager Number)
- Nationwide Paging with 800 telephone number access

- One time activation fee of $37 for programming and phone number selection.

- In Summary - After activation, the Pager is YOURS to Keep ! - This is NOT a lease ! - At time of order - a deposit is required for the first and last month of service (non-refundable), along with the one-time activation fee, and a $ 3.00 shipping charge. (Grand Total - $ 59.90 - Provides FREE Pager and 2 Months of Service - Each additional month of service is just $

9.95 per month, billed quarterly)

- Check, Visa, Mastercard, American Express are accepted for payment.

100% SATISFACTION GUARANTEE - CALL US TO ALSO FIND OUT HOW YOU CAN EARN INCOME FOR YOURSELF OR NON-PROFIT ORGANIZATION.

TO ORDER, E-mail your name and mailing address to: jpcirone@aol.com OR call 1-800-473-9934.

If you looked closely, you would have noticed that the TM-241 now has a /P2 label, means that it is the new CPU with improved intermod rejection. I cannot be modified for wide band anymore.

As for the China thing, you are going to find that all vendors are moving their manufacturing to China plants (Motorola has been doing this for a long time, you just never noticed).

The move to China is due to the labour costs in Japan have skyrocketed and they need to find it cheaper as hams don't have any money, and you likely won't pay double the price for a 2M rig.

Even Grundig (a large European company) has moved some of their manufacturing to China.

just my 2 cents worth...

One of these days I'll take my IC-2000H apart and figure it out again,
but I can tell you this; there are one or two sites for jumpers on the
display PCB. Using a piece of wire as a temporary jumper, I connected
each one and cycled the power. I'm not sure which one did it, but I
now have a radio that transmits from 140MHz to 150Mhz (and it only
transmitted from 144-148 when I first received it).

It took maybe ten minutes of messing around.

: No, their yelling back and forth arguing about who's cock was bigger,
: who called who, who fed ex'd what, who's son was a ham, who's annoying
: while they type in all caps.. THAT is spamming. YOUR spamming, telling
: someone the're spamming. Get a life..

A "spam", by net convetion, is a posting to multiple groups - where some of the groups have nothing to do with the matter of discussion. They are usually, but not always, of the "make money fast" type crap.

People sometimes continue the spam unknowingly, when they reply to a post without checking the newsgroups list - and trimming it to the applicable groups.

Your misuse of the word, to provide more emotional impact (apparently) does NOT change this meaning.

I was not saying that the others were spamming the net. Far from it, which you would realize if you bothered to read what I wrote. It is listed above, since you were polite enough to quote the comment. I even trimmed the groups to the radio groups - which are the only ones to which this particular discussion belong.

Yes I remember someone getting the factory fix which involved removing the pump from the tank and installing filters. If I remember correectly the fix was marginal and required more filtering outside the tank. Try some ferrite chokes on the fuel pump leads first and make sure the tank is grounded well.

Jay, you might want to try boosting the input AC. There are variable
"autotransformers" available that you can use to boost the AC up to
about 135 or so. This will probably give you what you need, unless it
is internally regulated. If it is internally regulated, then you will
have to adjust the regulation point.

Source record: 209412

I've had my TM-732 for a 3 years, and the screw that holds the hang-up pin stripped and had to be crazy-glued onto the back of the mic. I've also had problems with the remote control keys. The pressing the MR key will either get you the MR function, or the Band Change (PF) This is a majhor inconvience since I use one band to scan most of the time. I have had the mic apart and cleaned the contacts and that doesn't do anything.....

Good luck!
-Mike

: Can you imnagine casting an engine block for a weekend race car, or
: laminating your own fiberglass for skis, or fabricating a 35mm
: homebrew camera? If the stuff worked at all, you'd be lucky.

Jack, I think that this is a little unfair. While there are few
weekend car buffs who could make an engine from scratch, there are
also probably few hams who could make a power transistor from scratch
either. Both the hams and mechanics take existing parts and assemble
them into a homebuilt (homebrew) article.

I'm quite good with fiberglass and could make the skis (or even the
whole ski boat) fairly easily. Actually, with the exception of certain
industries, notably surfboards, the amateur builder can do better with
a fiberglass project than the factory can.

As for the camera, why would anyone want to make a 35mm camera?
I agree that it would be difficult, but why bother? There are a
group of camera buffs here in town who do build view cameras from
scratch. And I'm told that they are better than the factory cameras.

Don't get me wrong, I love ham radio, but its hardly a unique
hobby from the standpoint of homebrewing.

Interesting, but in my neck of the woods, spam is exclusively used to
describe cases of a single message being send separately to several groups
under separate Message IDs. And we call the use of excessive and
inappropriate cross-postings velveeta.

4976. my FT530 battery pack is dead!!!

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-03 00:00:00 UTC
From: ajlitt@mail.utexas.edu
Message-ID: <49t6g4$857@geraldo.cc.utexas.edu>
Source record: 209420

I have had an FT530 for about 2 1/2 years now, and it's given me outstanding service all the while. Unfortunately, my battery pack (7.2v 600mAh FNB-26) started to discharge within a day or two of recharging, and now won't accept a charge whatsoever. From what I know of NiCd cells in packs, some of the cells are internally shorted, and except for zapping them individually with high current as a temporary fix, I know I'll have to replace all of the cells soon. As a college student, my budget is very low, and instead of buying a new pack or getting this one fixed, I would like to replace some of the cells myself. My first big question is: how do you get the thing open? There seem to be no screws or clips holding it together. Also, once I do get the pack open, should I replace all of the cells, or can I get away with the ones that show very low internal resistance (I'll use a pwr. res & a voltmeter to check this)? If all else fails, is there a good place to buy a new pack just like this? Right now, I'm forced to run my talkie off of a 28Ah lead acid battery, which is good for transmitting at 5W, but reduces the radio's functionality as a handheld device. Suggestions will be MUCH appreciated!

This is precisely why I have avoided an ICOM purchase for the past decade. Fast and efficient QSK operation is so easy to achieve, that I have come to the conclusion that ICOM simply doesn't care. I would rate QSK effectiveness by manufacturer in following order:

Ten-Tec
Kenwood
Yaesu
ICOM

I really hate to put Yaesu third-down on the list, but they've got some listening to do as well.

I think you might be better off just breaking down and getting a tone board from Communications Specialists. As far as I know, the original boards are no longer made. (I'm hanging on to mine...) The aftermarket tone board will only set you back about $30. Of course, you won't be able to choose F1, F2, or F3 from the keypad, you'll have to use dip switches to choose your freq.

>let the guy make a living.

He did shop locally. And he was willing to pay extra for the value-added of being able to see it, to talk to a knowledgeable sales rep about it, to see it work. And he was given the same--no, a LESSER--amount of service as you'd get from HRO on one of their 1-800 lines. So--guess what--he can get it cheaper from HRO on one of their 1-800 lines! So let AARS compete with AES, HRO, Jun's, etc and starve on the margins.

As for your "we the consumers" declarations--speak for yourself! I haven't given up on the local store except where the local storekeeper has already given up on me. Advice, support, service--they're important to many of us still, and many of the businesses that provide it are still flourishing.

Any businessman who expects to treat a walk-in customer the same as a caller on a national WATS line shouldn't be surprised when nobody walks back out the door with merchandise in-hand. And he gets no sympathy (or patronage after I hear a few stories like this) from me!

Any speed is too fast for it's qsk. What you're doing in qsk mode is simply keying the vox relay. I makes a lot of racket and clips dots and dashes at any speed. Of course, the faster you go, the worse it sounds. I use mine on semi bk in mode with the delay set for .1 seconds. It sounds ok but of course its not really qsk. Another interesting point. In qsoing a friend with with my 706, he was watching me on his computer while using a KAM and KAGOLD software. It could not copy the 706. I switched of the qsk and went semi, this helped but copy was still poor. I switched over the the TS940 and copy was perfect. Something to think about I suppose. 73

: So soes anybody have more feedback on how fast the IC706 breakin responds? I
: have one on order, but this could be a problem. Not that I work a whole lot of
: CW above 30 WPM.... but how fast can CW be with good keying shape and no loss

This is a lot of work but may not be necessary. Check to see if the transformer
has a tapped primary that was intended to compensate for variations from the
nominal line voltage. You may be able to tap down on it and raise the secondary
voltage enough to get by.

Andrew, I can't help with instructions for tearing apart your FT-530's
battery pack, but I found your situation interesting, as that's exactly
what has happened to MY FT-530's battery pack, AND my 530 is also 2 1/2
years old (bought in June 1993).

My FT-530 doesn't get used enough, at least that's what I thought had
probably contributed to the batteries early demise. Some years ago, when
I travelled a lot on business, I used a Santec HT1200 2M HT quite a lot,
and its batteries lasted for several years.

So, I can't offer any pat solutions to your dilemma, but at least you know
that other people share the problem. I'll probably put up with it for a bit
longer, and then finally get irritated enough to get a replacement pack
from one of the NiCad battery outfits.

Gee Chris, I'm not sure whether to be offended by that remark or not.
;-)
Nowhere did I sign myself as a repeater maintenance pro. I'm simply a club member who bought and donated right at a $1000 worth of needed equipment (Amp, preamp, new rack, cables, etc...) to help our meager repeater cover the entire county, and was (am) like a kid at Christmas anxious to play with the new toys.

Also, if everyone knew all the answers this newsgroup wouldn't exist. No one would need it. <g>

>Seriously, if you rptr is hearing .25 or so on 2mtrs, DONT PUT A
>PREAMP on it!!!! LEAVE THE PREAMP OFF!!!!! You will only end up
>with intermod and/or desense in the rptr.....
Meanwhile we have temporarily pulled the pre-amp from the system. All else is currently working fine. Transmit is full and strong. Receive is the same as it was before any updating, and could still use improvement. Actually the 'Head Techie on Site' at the Hiway Patrol Comm center where the repeater's located has volunteered to work out the preamp situation, check and tune the cavities, and check all for proper shielding. Turns out he's a ham also and is tickled to have the equipment right there at his fingertips.

Thanks to all for your help.

If you're considering an ICOM radio, CW speeds well below 30 wpm should be of concern to you. The copy with their QSK is so poor, that I would be embarrased to admit that I was using an ICOM. IMHO, ICOM is still riding on their success during the '80s. Their product line is over-priced, and I feel that recently, they have scaled-down on the technology available to them. Competition has been getting brutal among all the manufacturers. Until recently, they didn't care about a few disguntled customers. Now, with all the electronic information services available to such a large potential customer base, they will have to meet and exceed our expectations for high quality products.

HELP!!!!!!! MY COMPUTER IS TEARING UP MY RECIVER!!!!I recently got a new rig....A Yaesu FT-990. My computer wipes it out....I have taken off all cables to keyboard,mouse,monitor ect....still there. Then I took ferrite split beads and put them on power wires in the box going to main board, drives.....still no change...Think its inturnal noise from the power supply....took off the antenna cable from rig and no more noise.....what else can I try?????? oh yeah...i also took aluminum foil and put it inside the box then put the cover on...still bad as ever..tried grounding it too......PLEASE HELP!!!! Thanks for any help de Mike/KN6VS

From: Fraser Bonnett <102432.1070@CompuServe.COM>
Message-ID: <49t527hla1@mhafn.production.compuserve.com>
Source record: 209443

Does anyone have any similiar experience with RFI being generated by the beam sensors on the new generation of door openers?

I have installed STANLEY ST200 door openers, and found that the beam sensors cause SERIOUS RFI to 10 meters about every 12kHz. It sounds like some sort of oscillator. I've tried wrapping the beam sensor cables on ferrite chokes, AC line filters and ferrite chokes on the opener motor, all to no avail.

Any ideas? By the way, disconnecting the beam sensors renders the door inoperative!

Fred, I'm about 99% sure that an article in 'QST' has what you're asking for. I've just bought an ICOM 706, and want to do the same thing for it (ie. save the bucks that ICOM wants for their interface).

Can't remember the date (am at work on a Sunday night), but just within the last few years, 'QST' had a computer interface article that covered ICOM, pretty sure Kenwood, and the newer Tentec's (since they began to use ICOM's CI-V interface standard), showing how to build the TTL to RS-232 interface, and also discussing the CI-V (ICOM) CDMA (Collision Detection - Multiple Access) interface standard.

I'm amazed at the money that the manufacturers charge for their silly interfaces, when a few dollars worth of parts are all that's needed.

If you can't find the article, drop me e-mail.

5003. IC706 Yellow Wire Mod OK!

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-03 00:00:00 UTC
From: ad7k@bighorn.accessnv.com
Message-ID: <49u1ba$t27@bighorn.accessnv.com>
Source record: 209447

In a Sales Bulletin dated November 29, 1995, Icom officially says:
"OUT-OF-BAND RECEIVE MODIFICATION
"A factory approved receive modification is enclosed. It's very simple, just cut the yellow wire (of course wire colors may change in the future, so it's best to locate the proper wire with the schematic drwaingt, just to be safe.
"This modification substantially improves the FM VHF out-of-band receive performance. However, you may notice some diminished sensitivity on VHF WFM broadcasts.
"An HF MARS trsnsmit modification is also attached. No approved VHF transmit is available at this time. We are working on it."

Another paragraph says:
"HM77 DTMF Microphone"
"We have received many requests for a DTMF microphone. After extensive testing, we feel the HM77 is your best choice. The transmit audio soinds a bit different to some observers."
(Note - the HMN77 should be available at Icom dealers in the near future .. at the time Icom distributed this Sales Bulletin, they did not even have a price on the HM-77! It is now priced, and should be available soon.)

Please note that these notes are typed verbatim from the Icom Sales Bulletin - typos are theirs, not mine.

Anyone think about the real limits of DSP? I have wondered how much a really powerful machine could do. Suppose we wanted to do DSP at a "real" Intermediate Frequency, say 9 MHz. How often do I need to sample to do a good job for DSP? How much of the processor time would be needed for the algorithm? Can we ever get there?

FOR SALE: Drake TR-4CW/RIT, MS-4, AC-4

Rig is in MINT condition. Has only 10 hrs. of use since factory recondition
by Drake.

Includes: MS-4 speaker, and AC-4 power supply.

Works great and looks great. 2.1khz filters make for selective reception.

It has all 10m crystals installed and 500khz CW filter.

Noise blanker and Receiver Incremental Tuning.

Now is the time to buy a tube rig--it will keep you warm on those long, cold
hamming nights and weekends.

This was/is my back-up rig, but I never have needed it and am not very active
nowadays.

Will sell for $350.00. You pay shipping, etc.

I have had my 732 for about 3 years with no mic problems other than
the TX audio was very high and "tinny" sounding. Upon checking the
inside of the mic, I found that there was an extra ceramic cap in mine
that wasn't in others. <snip went the cap>. Now it sounds like all
other TM-732's. On your clip being broken, take the entire mic and
clip to a telephone shop that services large PBX or key systems. The
connector used on these mics is the same as a lot of phone systems.

>over both of the above models thou. The 530 is a full featured radio
>with a real battery pack. Check them both out.

>73 Barry KB6CV

I owned an FT470, closely examined my friends FT-530, and then bought an
FT-51R. The 530 is a slightly improved 470, in the area of features, and
is slightly smaller than the 470 (still big). The 530 is a good radio, but
the 51R has the following pluses:

- MUCH smaller
- lighter
- comes with a 600mAh battery, that lasts as long as
the 530s with the same power output, same basic battery
size, power, and charging options as the 530.
- more paging features (although not many people use them)
- less distorted RX audio
- programs from a PC

The Kenwood/Yaesu is a pretty close match, but I chose the Yaesu over the
Kenwood 79A because the 51R:
- is smaller
- 100% software pots, volume, squelch, etc. You can config
the top dial button to be a volume control if you like, but it
is a switch, not a pot. Even the TX deviation is keyboard
adjustable in the diagnostic mode without opening the radio.
- programs from a PC
- programs more naturally (my opinion)

- fully backlighted display AND keypad

My advise: Don't buy until you also go to a store or meet with people that have a 79 and a 51, and hold them in your hand to see which one feels best to YOU.

5013. Icom IC-706 Yellow wire Receive Mod

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-04 00:00:00 UTC
From: aust@gandalf.sp.TRw.COM
Message-ID: <9512041807.AA25768@shelob>
Source record: 209457

For Improved f
hearing above 148Mhz for the ICOM IC-706:

Tools required:

1) #0 Philips head screwdriver
2) 10 - 15 watt pencil tip soldering iron
3) Magnifying glass
4) Tweezers

Remove the TOP cover by removing three philips head screws on the top
and one on each side. The fourth yellow wire from the right on the header,
should be cut open. just above the 9 MHz SSB filter FL-30.
This controls a low pass filter at 120MHz which remains
in service when above 148MHz and make the IC-706 very deaf above 148MHz.
Note: Be careful, another yellow wire exists on the same header.

Above is the new official Mod from Icom USA !!!
This increades sensitiivity avove 148MHz, but degrades
sensititivity in the 88-108 FM Broadcast portion.
****
Below is a mod that takes the yellow wire mod one step further, to
restore FM broadcast sensitivity and keep reception above 148MHz.
Connecting open yellow wire to J8 VCO transistor switch bank.
I tried this mod and it works, If I just did the yellow wire mod, I noted
RF images from the 144-148MHz, falling in the 82-84MHz region, by reconnecting
it to the VCO switch bank, no more images, and FM broadcat restored, with good
sensitivity above 148MHz. Only noted that FM broadcast FM band can overload
aircraft band betwwen 118-129Mhz, I switch the preamp off(green to black) and
the problem goes away and still can hear aircraft.

73
Mike
WB6DJI

I suggest that a pin with a plug be done for this J8 mod for future Icom 706's
radios to implement this in a production environment.

>>120 MHz instead of 144/148.
>
> Does this mod affect HF or 6m? After the mod, what frequencies use the LP and
> what frequencies use the HP filter?

The mod affects only frequencies above 60 MHz. If you just cut or remove the
yellow wire, the HP or actually 2m bandpass filter is used all the time.

Last night I took the loose yellow wire and connected it to a VCO control
switch transistor (?) on the lower PC board. Now I have the LP filter in
use between 60 and 129 MHz and the 2m bandpass between 129 and 200 MHz.

There are five SMD transistors on the lower PC board just behind the
"MENU" button. The one in the middle controls the VCO that is in use
from 60 to 129 MHz. The single pin has 5V when within this range.

The mod affects only frequencies above 60 MHz. If you just cut or remove the
yellow wire, the HP or actually 2m bandpass filter is used all the time.

Last night I took the loose yellow wire and connected it to a VCO control
switch transistor (?) on the lower PC board. Now I have the LP filter in
use between 60 and 129 MHz and the 2m bandpass between 129 and 200 MHz.

There are five SMD transistors on the lower PC board just behind the
"MENU" button. The one in the middle controls the VCO that is in use
from 60 to 129 MHz. The single pin has 5V when within this range.
There is a trace from this pin to a plated-through hole near J8.
This is a good place to connect the wire. (I haven't even seen the
schematic so cannot say if this is the best way to do it.
But it works for me.)
****
(Notes: de WB6DJI) found this point with a DVM to identify right plated
thru hole(Just to to left of J8 marking on board on bottom side of radio)
I put a 3/8" wire, reheated it and got it to say in
in the plated thru hole next to J8, the attached the open ended yellow wire to
it. Careful not to damage the gray cable with your soldering iron, its pretty
tight, small area in there!!
****
129 MHz seems to be quite close to the cross-over point of the LP and
2m BP filters. Here is a listing of the (NBFM) signal strength needed
to "light" the first segment on the S-meter on each frequency:

MHz uV/LP uV/BP
125 .8 2
135 12 .5
145 .15

155 30 .5
165 3
175 11
185 140

After the mod I can listen to the Helsinki airport on 134 MHz but the
Meteo on 128.4 is still drowned in intermod from the FM BC band.

> thanks and 73, Cecil, KG7BK, OOTC (not speaking for my employer)
Neither am I. Proceed at your own risk etc. And have more fun with the 706 !

Heard a QSO on a repeater last night that could have been your posting: one guy had taken his battery pack apart and replaced the bad cell, but the repair didn't last long. Another cell went bad later. He gave up

I personally would buy another AFTERMARKET batterypack. I would get one of the bigger ones, so I could yak longer!

Good luck.

>Clark
>WA3JPG

A lot depends on what you want to do with the signal and the bandwidth
of the signal. You say "at a real IF like 9 MHz" -- do you mean that
the signal has already been band-limited at that point, or is it very
broad-band? The crucial "how powerful" question is set by the bandwidth,
not the carrier frequency.

If you want to support say the entire 20M band (350 khz wide), then it
must be sampled at a rate of at least twice that, i.e. 700 ksamples/sec.
To do even the most trivial DSP operation you would have to squeeze all
operations you want to do into 1.4 usec windows. To do almost any meaningful DSP
operation, you will need 20-30ish operations and the complete operations have
to be executed at a 15-ish MHz rate. Since the x86 architecture has many
machine cycles/instruction, a fast Pentium would be hard pressed to do
anything at all! A specialized DSP chip with pipelined single-instruction-
per cycle architecture might be feasible. This is the complication that has
prevented a complete DSP radio from being practical.

On the other hand, if you want to do something with DSP over a ~20 kHz bandwidth,
then the tables are turned. You can use a simple Sound Blaster (44.1 kHz sampling
rate) in a high-end PC and do IF processing easily with hardware you can buy
today at Circuit City. It's only $oftware!

To a more responsive answer, you need to specify what DSP functions you want
to do. Are you looking for a digital DSP modem? Or do you want QRM-killer
filters on SSB? Or do you want to build the entire radio in software?

From: aa0yt@mo.net
Message-ID: <49v2ts$8j6@Twain.MO.NET>
Source record: 209469

Just got my new IC-706 in and I love it! Haven't done the "yellow wire" mod... waiting for bravery -- or tomfoolery! -- to set in. I have a question, however, for you modification folks.

Has anyone seen a way to mod this rig to leave the volume on (pinned to the frequency you are listening to) while letting the band scope scan the band for you. During openings, it might be nice to be able to talk to someone, and see that there's some activity up the band. Just a thought!

Thanks!

Source record: 209473

<SNIP>
>fair price for a TenTec Analog #570 (Century 21) 10-80M CW Xcvr?
(r) I just sold a VERY clean, unmodified C-21 for $150. I think
this is about the going price. W/manual, but no accessories.

>Also, can anyone tell me if they have used one of these rigs and
>what their opinions are? I know that it's CW only. My son and I
>are just trying to get on the HF bands. It has 5khz (hope that I
>have my units correct), 2.5 khz, and 1khz filters. Will they be
>good enough?
(r) The C-21 receiver is direct conversion, meaning you can hear
both sides of zero beat. This is a distinct disadvantage on
a busy band, because it allows twice the signals into the
filter passband as a superhet receiver would. The filters in
the C-21 are audio filters, not i-f filters, and are really
not sharp enough to knock out heavy QRM. On a quiet band,
with few stations around, the rig would do fine. This is not
usually the case any more.

>Does a newer filter fit it and is it needed?
(r) No, you can't add filters, although they would really
do a lot of good if you could. Since the rig is of a
direct conversion design, there's no i-f, hence there
is no place to add i-f filtering, only audio filtering
which the rig already has. One of the outboard DSP's
might be worthwhile to use with this rig.

(r) Other comments: the C-21 has Ten-Tec's legendary Full
Break-in CW (QSK). Nobody does it better! The rig is
115 VAC powered, and can not be run on 12 VDC. It's a
bit large physically for what it does (a lot of empty
space inside the cabinet). The VFO is very stable and
the transmitted signal is very clean (this is also the
kind of thing Ten-Tec is known for).

(r) Final opinion: (and this is just my personal opinion,
having owned two C-21s over the years, and comparing
them to other rigs that can be bought for not too much
more money)... I'd save the $150, add another $150 to
that, and seek out a Kenwood TS-520 or something along
those lines.

(r) If anyone wants to flame me, do it off the newsgroup!

I dont know about the transceiver, but you can use it in packet. I have one tied to my TNC via a null modem and A/B switch. I can turn the modem on, and call it (via phone) and be on packet! Works great, and I use it all the time. This is a nice set up, because you dont have to leave a computer on all the time. :)

We're almost there now. Video production/editing equipment (DSP)
already handles signals with bandwidths greater than 5 MHz. This
technology is undoubtedly going to spill over into our equipment
in the near future.

I predict that in a couple more years, the current wave of Amateur
DSP units will be as obolete as 88 mh toroids.

>Suppose we wanted to do DSP at a "real" IF, say 9 MHz.

Well, Nyquist's Theorem states that maintain the information conteained in your real-time signal, the discrete time signal must have a minimum sample frequency of double, ie 18 MHz. However, the greater the sample frequency the greater the resolution, a practical solution would be three times, ie 27 MHz.

>Anyone think about the real limits of DSP? I have wondered how
>much a really powerful machine could do. Suppose we wanted to
>do DSP at a "real" Intermediate Frequency, say 9 MHz. How often

I think the three basic issues are sampling rate, extent of processing per sample, and the A/D-D/A conversion resolution (bits of conversion).

I think we're a long way from 9 MHz IF DSP - Kenwood's TS870 has as I recall a 11 _kHz_ IF where the DSP is done. As the intermediate frequency is raised you'll need to sample proportionally faster, but I also suspect will have to do more computing "work" per sample to create the sharp-cutoff "boxcar" filters we all like. The other challenge I suspect will be around for a long time is the relationship of conversion resolution to receiver dynamic range - without enough conversion accuracy weak signals could just get lost in the round-off error of the conversion process, and higher conversion accuracy again points to more computing "work" per sample. I think the last problem (conversion accuracy) is not such a big deal with audio DSPs because audio DSPs work post-AGC in the receiver (which gives you only a narrow span of signal levels to deal with), but pre-AGC (where _I_ would want my DSP action to occur) exposes the DSP to ajacent signals of widely differing signal levels.

Nothing like being a wet blanket...

I can't argue with the article on AARS because I've never BEEN to
Austin, much less shopped there.

However, AES down in Las Vegas has a person on staff named Squeak who
for my money is the sharpest, easiest to get along with ham radio
sales person I've ever had the pleasure of dealing with. If you have
a question that Squeak can't answer, you've got yourself one hell of a
question.

I've got nothing to do with AES other than being a satisfied customer.

> Anyone out there have a diagram I can have?
>
> Thanks and 73! Fred kq6bc
>

Hi Fred...don't bother with 1488/1489 driver/receivers.
You need 3 supply voltages or a voltage doubler/inverter if you go this
route.
Check out the MAX232 (by Maxim) or the Motorola equivalent. THese
chips have 2 receiver and 2 drivers PLUS a charge pump and inverter...
this provides the necessary +/- 12v using a single 5v supply.
I made an IF232 equivalent circuit using a MAX232 and an opto-isolator
chip for much much less than Kenwoods version. (< $10)

Leave me e-mail if you want more details.

Source record: 209305

Hi there!

We will get a new 2/70 rig for our club station (SK6AB), and at the moment the Icom IC-820 and the Yeasu FT-736 seems to be the most interesting rigs on the market. It will be used for/with:

- Preamps and power amps on both bands

- 1k2 and 9k6 packet

- Satellites

- Microwave transverters from 2 m to 23, 13, 6 and 3 cm.

- All modes...

If you have any suggestion, experience or warnings for us, please write to this group or me, thank you!

I bought a new one (assembled) from TenTec back in June. Its a great little
unit. Puts out ~10 watts and has good RX. I use the xverter with a FT-1000D
and its much better selectivity wise than my older 6m multi mode.

I have a 1993 Explorer with a Kenwood 742A with 2m,220, and 440
installed. I have two seperate antennas. One, a COmet BC-10 2m/440, and
the other a quarter wave 220. I experience the same problem when
transmitting. Sometimes the cruise control will accelerate, sometime
deaccelerate. When the vehicle was wet a couple of weeks ago, even the
rear wiper would cycle on/off!!! Really wierd..I assume that Ford really
never decoupled their computers or feed lines very well. I never
experienced anything like that with my Toyota 4-Runner prior. I have
heard and read a lot of people having the same identical problems though..

FORD ARTICLE # 95-11-3 (portions copied here)

A "Whinning/buzzing" noise in the speakers of the entertainment radio or
two way radio on vehicles with an in-tank electric noise from the fuel
pump.

Correction:
Install an electronic noise RFI filter (F1PZ-18B925-A) on the fuel pump
inside the fuel tank. Refer to the following Test Procedure to confirm
that the concern exists, then refer to the Service Procedure for repair
details.

Note: Some light trucks require one (1) RFI filter for each in-tank
electric fuel pump on Mulit-tank vehicles.

Test Procedure:
Fuel pump radio noise is relatively constant and changes only slightly
with vehicle speed. If the frequency of the noise varies or the noise
comes and goes with the vehicle speed, then it is not the fuel pump and
this fix will not be effective. The following procedure will help
determine if the fuel pump is the cause of the radio noise.

1. Turn on the radio before the key is turned on (assuming the radio will operate without the ignition key. You may need to put the ingnition key in the accessory position).

2. Turn the ignition key to the RUN position (do not start the engine).

3. The fuel pump should run for about 1 second witht he key in the RUN position with the engine not running. Listen for the noise in the radio. If the noise is present while the pump is running and stops when the pump stops then the noise is being generated by the pump and this procedure should help.

1. Remove the fuel pump sender assembly from the fuel tank. Refer to the appropriate Service manual, Section 24-35 for cars/light trucks and Section 10-01 for compact trucks, for removal procedure.

2. ON vehicles without fuel delivery module, remove the negative and positive connectors from the fuel pump.

a. Cut the wires to the fuel pump 3" from the flange of the fuel pump and discard the wires.

b. connect the RFI filter connectors to the spade terminal on the fuel pump.

c. Cut and solder both the red and black wire of the RFI filter to the red and black wires of the flange. Use shrink tube over the solder connections.

The above in the entirety, including diagrams, can be obtained from

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.swap,rec.radio.swap

For Sale:

Ranger RCI 2950, peaked & tuned by reputable radio technician at local ham radio store.. on low power, this unit deadkeys 2w and swings to 16w at full modulation. high power deadkeys at 9w and swings to 25w. Sideband PEP is 35w.

Wilson 1000 is the white magmount model.

Palomar 200 deadkeys 150w and swings to 220w on high power.. (3 power settings, with preamp)

People tell me that this setup sounds crystal clear and viciously LOUD, even with the stock microphone. I bought everything about 2 months ago, played with it for about a month, and it's been sitting in my closet since. I finally have a HAM liscense now and I have no need or desire to own CB equipment.. I've got my eyes on a nice VHF/UHF all-mode radio and I must liquidate this stuff in order to afford it.

$425 takes everything... I do not want to part it out. this price is FIRM.

5062. IC-706 "Band Scope"

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-05 00:00:00 UTC
From: aust@gandalf.sp.TRw.COM
Message-ID: <9512050306.AA26645@shelob>
Source record: 209320

The IC-706 , when in the band scope mode is sweeping the VCO, unlike
a spectrum Analyzer with an adjustable IF filter Bandwidth, that's is
why the audio is muted, in the Spectrum Scope mode.
For a true Analyzer with adjustable IF filters, the radio would be a LOT
larger in size and more expensive.
For what it is, its a nice feature, but to scan and listen to fixed
frequency at the same time, I think is not possible.
Maybe someone else can verify this.
73

Enjoy my IC-706, its a great little radio!!!
Traded in my semi-new Kenwood TS-50 for it!!

Date: Mon, 04 Dec 1995 14:06:11 GMT
From: aa0yt@mo.net (Colin Wright)
Subject: IC-706 "Band Scope"

Just got my new IC-706 in and I love it! Haven't done the "yellow
wire" mod... waiting for bravery -- or tomfoolery! -- to set in. I
have a question, however, for you modification folks.

Has anyone seen a way to mod this rig to leave the volume on (pinned
to the frequency you are listening to) while letting the band scope
scan the band for you. During openings, it might be nice to be able
to talk to someone, and see that there's some activity up the band.
Just a thought!

Thanks!

John:

I've got a KDK 2016A (a little newer than the 2015), and I believe there was one, and perhaps 2 or 3, 'conversion' articles in the magazines, for at least some of the KDK gear, to expand their coverage (check "73 Magazine" for the late 1970's).

I think the 2015 & 2016A were reasonably similar. Best I can recollect, the synthesizer takes parallel BCD data, and with its discrete circuitry (ie. not surface-mount like the new stuff), it's not too hard to tie-in modifications.

Hi Roger, sounds like the problem I had with my ICOM 725. The Phase-Locked-Loop locks sometimes and sometimes not. It's probably a simple adjustment but I sent mine to ICOM to be recalibrated.

I have all of the posted Ic-706 mods as far as D59 and the yellow wire
are concered..I have a question about the D59 mod. It seems some of
the listed mods mention that D59 opens VHF (118-174) as well as HF..
One other post mentions that it only opens HF..Another mentions it
opens expanded HF full power and Expanded VHF only milliwatts.....
can anyone straighten this out..I don't even have the 706 yet and
am planning on getting one early spring..(maybe Santa will surprise me).

Steve, wa2nhz

I just heard from a contester that the front end (HF) overloads badly on strong signals. Can anyone confirm this?

It probably won't be a problem as I want to use the rig mobile but it would be nice to know.

Thanks,

Jeff

The local "candy store" is Amateur Radio Supply Co. at 5963 Corson Ave. S. #140. The phone number is 767-3222. Take the Corson/Michigan exit from either north or southbound I-5 and it's on the right in the strip mall before you get to Michigan.

5074. Yaesu Telephone Num 5/10

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-05 00:00:00 UTC
From: clint.bradford@woodybbs.com
Message-ID: <93.10763.7583.0NFBB9C6@woodybbs.com>
Source record: 209332

Subject: Yaesu Telephone Numbers

(Continued from previous message)

- alternative procedure
- note: this short-cut requires you to enter 430.00 MHz
in step 1.

5. Press RPT twice for a "+" (plus) indicated
repeater offset.
6. Press REV once.
7. Press RPT twice to select the "-" (minus) repeater offset.
8. Press REV once. You should have 1030.00 MHz displayed.
9. Press F/M and hold the down-arrow stopping at 999.00 MHz.
10. Press REV once. You should have 399.00 MHz displayed.
11. Press F/M, then hold the up-arrow) key to increase the
displayed frequency. Stop at 400 MHz.
12. Press RPT twice to select simplex operation.
13. go back to #9 in previous list

Steps for setting the UPPER VHF limit to 200 MHz.

1. Program the frequency for 140.00 MHz *SIMPLEX*.
2. Press F/M, then RPT for the offset.
3. Enter the code 0000 into the keypad.
4. Shut the transceiver off, then turn it back on.
5. Press RPT twice (for a "+" (plus) indicated offset).
6. Press REV *ONE* time.
7. The radio should now display 1140.00 MHz.
8. Press F/M, then hold the down-arrow key to decrease the
displayed frequency. Stop at 800 MHz.
9. Press RPT twice to select the "-" (minus) repeater offset.
10. Press REV once. You should have 200.000 MHz displayed.
11. Press RPT twice to select simplex.
12. Store this in the "U" memory. (See above steps...)
13. Press F/M then RPT then enter 0060 (600 Khz repeater
offset) then press RPT again.

Steps for setting the LOWER VHF limit to 100 MHz.

1. Program the frequency for 140.00 MHz *SIMPLEX*.
2. Press the F/M, then RPT for the offset.
3. Enter the code 0000 into the keypad.

4. Shut the transceiver off, then turn it back on.
5. Press RPT twice (for a "+" (plus) indicated offset).
6. Press REV *ONE* time.
7. The radio should now display 1140.00 MHz.
8. Press F/M, then hold the down-arrow key to decrease the
displayed frequency. Stop at 1100 MHz.
9. Press RPT twice to select the "-" (minus) repeater offset.
10. Press REV twice. You should have 100.000 MHz displayed.
11. Press RPT twice to select simplex.
12. Store this in the "L" memory. (See above steps...)
13. Press F/M then RPT then enter 0060 (600 Khz repeater
offset) then press RPT again.

Notes: To use the higher frequencies you have to select the "U"
channel and press MR. This puts the handheld in the "MT" (memory
tune) mode. From there you can scan down or use the (DIAL) knob to
go to a lower frequency. ...Likewise for the lower frequency
memory. Any frequency selected using this method can be stored in
any memory.

My radio will not let me go up in frequency, only down. If I try, the
rig will default back to the original ham band. I had to be careful
when doing these mods.

One trick I found when initially setting up the VFO with the
expanded upper and lower frequencies is that in steps 5 (and 9) if
you select "+", pressing REV adds 1000 MHz to the display or
subtracts 1000 MHz if it has already been added. If you selected
the "-" (minus) repeater offset, pressing REV will subtract 400 MHz
if the displayed frequency is 1000 MHz or higher, or subtract 600
MHz if the displayed frequency is below 1000 MHz, until any more
subtractions would run the frequency negative, after which it
alternatively adds or subtracts 600. You can mix the up-arrow
down-arrow method with the "+ -" offset/REV combination to reduce
the time getting to the desired frequency. With these tricks, many
permutations can be found to get where you want to be very quickly.

I have discovered the code "5555" works as well as "0000" for the
enabling code.

Hi out there,

with christmas comimg closer I' thinking of some new VHF/UHF rig for my new shack (I moved). I also want to be able to work satellites.

Some OM recommended the FT736 and others the TS790. Since there are quite some bucks to be spent for such equipment I'd like to hear some pros and cons about them from people who actually are using them. Maybe there are even more good boxes to be considered?

PM or post - as you like it.

The first thing I would check on those tubes is whether thay've gone gassy--in a darkened (not necessarily totally dark) room, inspect the tube closely while operating (NOT just the filament lit, but while the tube is actually doing some work, probably in transmit mode unless of course it's a receive-only function the tube serves) and look for signs of any purplish-blue glow down inside. My KWM2A had some gassy tubes--type 6U8A are particularly prone to this--in the audio section and everyone complained my audio sounded like crap. Yet the same mic on a 32S3 (same audio circuit) sounds fine. Don't screw around with hamfest-special tubes; these days all tubes are getting to be old enough New Old Stock that one molecule at a time, air has started to intrude. What happens is, the tube has gas, so it runs too hot, which liberates more gas, which heats it up...the end result can be a meltdown-inducer called "thermal runaway" where the idling plate current with no drive applied keeps escalating until the tube is destroyed. There is an internal structure in the tube called the "getter" whose job it is to absorb stray gas molecules--if you can put filament and plate voltage to the tube with a big enough series cathode resistor to limit the plate current to a safe value and just let it cook, sometimes they can be reclaimed this way. However, it's a pain in the ass, to put it mildly. On the other hand, you can call Fair Radio in Lima, OH and order the tubes you need--they're real good about checking for stuff like this before they ship and used-but-good tubes (actually more reliable since all the sudden-infant-death-failure tubes are already culled, HI!) are only a couple bucks apiece...of course, with an oven, a vacuum pump, and some specialized equipment...
By the way, brand-new twentyfive-buck new old stock tubes from the local tv shop in unopened boxes are no better bet than any others. I've had a real run of gassy tubes here lately--some of the industrial suppliers like Newark will stand behind their stuff, but I promise you will pay through the nose at their prices. The old JAN military surplus tubes in the manila-colored boxes seem a little better...the only other alternative is to resort to new-manufacture Chinese or Russian tubes and, frankly, their reliability sucks except maybe for the Svetlana transmitting tubes...
Anyone, everyone, please, lets keep an eye out for any further infor on how to reclaim gassy tubes--there are only so many left in the world and this will become more and more pertinent as time goes on.

Hope this helps. 73.

5088. Yaesu Telephone Num 4/10

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-05 00:00:00 UTC
From: clint.bradford@woodybbs.com
Message-ID: <93.10762.7583.0NFBB9C5@woodybbs.com>
Source record: 209346

Subject: Yaesu Telephone Numbers

(Continued from previous message)

Software UHF Receive Expansion:

Effect: extend UHF Rx to 500MHz without shrinking Tx range

How: Trick 470 into accepting big number in U register.

Caveat: This mod acts differently on different radios.

1) Turn the beep on. (Some, perhaps all, 470's require that
the key-press-beep function be on in order to do this.)
2) Program the frequency of 450.00 MHz simplex.
3) Set the repeater offset to zero (F/M RPT 0000) but DON'T
get out of the set mode (don't hit RPT again).
4) Turn the radio off then back on.
5) Set a "+" offset (press RPT twice).
6) Press the REV button one time.
7) The radio should now display 1450 MHz.(The radio will not
operate at these frequencies. My service monitor shows
that above 500 MHz the rx is very weak.)
8) Use the shifted down-arrow key to tune this frequency down to
around 500 MHz (press F/M, press and hold down-arrow). Yes,
this takes a while.
9) Store this in the "U" memory. (press and hold F/M until
you hear two beeps, rotate tuning knob until "U" appears in
upper left, press F/M again).
10) Reset the repeater offset to 5 MHz. (F/M RPT 0500 RPT)

Result: By selecting the "U" memory and the using the memory
tune fuction (select "U" memory and then press MR), you can
tune to the desired frequency and then store it in another
memory.

Bugs: Above 500 MHz, some radios will let you tune up and
down in frequency, some won't (they jump back to the ham
band). Some radios will let you enter a frequency above 500
MHz on the keyboard while in memory tune mode, some won't.

Attributed: Darrell Sego KM9S

-=-=-=

Effect: Force a non-standard frequency into a VFO, store this
as an upper limit in the "U" or "L" memory.

Caveat: For these steps to work properly, I had to have
"Beep" enabled and *NOT* have the "L" and "U" memories locked
out.

Steps for setting the UPPER UHF limit to 500 MHz

1. Program the frequency for 430.00 MHz *SIMPLEX*.
2. Press F/M, then RPT for the offset.
3. Enter the code 0000 into the keypad.
4. Shut the transceiver off, then turn it back on.
5. Press RPT key twice for a "+" (plus) offset indication.
6. Press REV button once.
7. The radio should now display 1430.00 MHz.
8. Press F/M then hold the down-arrow key to lower the
displayed frequency. Stop when 500.00 MHz is displayed.
9. Press RPT once to select simplex operation.
10. Press F/M and hold until you hear two beeps.
11. Rotate the (DIAL) knob until the channel "U" is displayed.
12. Press F/M again, you should hear a beep.
13. Press F/M then RPT then enter 0500 (5 MHz repeater offset)
then press RPT again.

- alternative procedure (faster but a little more complicated)

8. Press RPT twice to select the "-" repeater offset.
9. Press REV twice. Frequency shown should be 630.00 MHz.
10. Press F/M then hold the down-arrow key to lower the
displayed frequency. Stop at 500.00 MHz.
11. Press RPT twice to select simplex operation.
12. Go back to #10 in previous list...

Steps for setting the LOWER UHF limit to 400 MHz.

1. Program the frequency for 450.00 MHz *SIMPLEX*.
2. Press the F/M, then RPT for the offset.
3. Enter the code 0000 into the keypad.
4. Shut the transceiver off, then turn it back on.
5. Press RPT once (for a "-" (minus) indicated offset).
6. Press REV *THREE* times.
7. The radio should now display 050.00 MHz.
8. Press F/M, then hold the up-arrow key to increase the
displayed frequency. Stop at 400 MHz.
9. Store this in the "L" memory. (See above steps...)
10. Press F/M then RPT then enter 0500 (5 MHz repeater offset)
then press RPT again.

(Continued to next message)

5089. Yaesu Telephone Num 6/10

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-05 00:00:00 UTC
From: clint.bradford@woodybbs.com
Message-ID: <93.10764.7583.0NFBB9C7@woodybbs.com>
Source record: 209347

Subject: Yaesu Telephone Numbers

(Continued from previous message)

mods have been performed.

Due to a loophole in the tuning software, you may tune from the current frequency towards the normal operating range (430.00 - 450.00), but not away.

Unfortunately, you are still subject to the "tune one way only" syndrome. To bypass it, you must store some frequency in the "L" memory. It doesn't matter what this frequency is, but it has to be below the "U" memory and, preferably, below any other frequency you want to use. You may store a very low frequency here too (0.00MHz).

BUT, the software isn't that dumb. To trick it, both the "L" and "U" memories must be filled and active (not set for SKIP), AND you must access the out of band frequencies from the MT (memory tune) mode, AND you must start from either the "L" or the "U" memory.

To use MT:
1) Press MR and select either the L or U memory.
2) Press MR again, a small MT should appear on the left of the display.
3) You may now tune with the arrow keys, Dial knob, or directly enter frequencies with the numeric keypad.

Attributed: kd6hr.El_Segundo@xerox.com (Pete McAfee)
[ed. It looks like Pete may have been the first to discover some of these neat tricks... any comments?]

-=-=-=

I noted the reading on the signal strength meter in the Yaesu. On the VHF band the number nine was on steadily, on the UHF band the number nine was blinking. As I changed frequencies I adjusted the amplitude of the signal generator to keep the signal strength meter on the Yaesu at the same level. The amount I had to crank up the output of the signal generator is the reduced sensitivity, here is the data:

VHF
freq: relative sensitivity:
136 -14 dB
140 -3 dB
144 +1 dB
146 0 dB reference point
148 -1 dB
155 -6 dB
160 -22 dB
165 -29 dB
170 -38 dB
174 -44 dB

UHF:
freq: relative sensitivity:
400 no reading, nothing, -infinity dB
401 -40 dB
402 -38 dB
405 -34 dB
410 -27 dB
420 -9 dB
430 +1 dB
440 0 dB
450 0 dB
460 -17 dB
470 -26 dB

Results: The radio is good outside the ham bands, but the sensitivity really starts to suffer. I hear the local police at 460.375 quite well, so -17 dB is still usable, but not as good as a scanner would probably be. VHF down to 100 MHz or UHF down to 400 MHz is a fantasy. As I mentioned in another post, if the frequency ranges are extended too far, you start picking up signals at the wrong frequencies. National weather service (162.4) received at 119 MHz, coast guard channel 12 (156.8) received at 200 MHz, 2 meter repeaters received around 190 MHz and again around 182 MHz. Its hard to say just what the usable ranges are, but something like 136-165 MHz in VHF and 410-470 MHz in UHF, and even then its not great at the ends of these ranges.

far as I can tell my mod is the same as would be done if it
was officially installed although the service manual doesn't
show where to connect it. It has just 3 wires, power, ground
and audio out. It is activated by applying power using the
small button above the PTT so you can press both at once to
call and then slide your thumb down to release the tone
button.

The board consists of a 2*color burst freq xtal and a
74HC4060 CMOS oscillator divider giving 7.16MHz divided by
4096 = 1748 Hz. The chip is surface mounted so they can get
the whole thing down to less than 0.5" square.

Subject: Yaesu Telephone Numbers

(Continued from previous message)

The FT470 is wired like an Icom. You connect the audio from
the TNC to the tip of the mike plug through a capacitor and
connect the PTT to the tip with a resistor. The Icoms and
Yaesus use a "leaky ground" to generate PTT. The problem with
this approach is there is a tradeoff between rapid PTT and
audio level and response. Typical values are .1 ufd and 2.2 k
ohms. The RC time constant limits TR turnaround.

A better scheme is to use a tiny audio transformer sideways
like so,

```
TNC PTT----------))))))))))))-------------> radio tip (audio)
============
TNC AF OUT-------))))))))))))----X--------> radio sleeve (gnd)
|
TNC GND--------------------------|
```

You can rip a suitable transformer out of an old transistor
radio or buy one from Radio Shack.

You should carefully set the audio level so you wind up with a
3 khz deviation for your tones. Don't exceed that level or
many units will have trouble decoding your packets. Make sure
you have the power saver on the 470 turned off when you run
packet or you'll miss the first part of every packet. This
can drive you nuts because everything seems to be working but
nothing prints.

One last note: put some distance between the antenna and the
radio and use shielded cables on your TNC. Otherwise the RFI
and RF feedback will ruin your packet operation.

(Continued from previous message)

Intermod Cure:

I sent my Yaesu 470 in to Yaesu U.S.A. almost a month ago for
them to perform the modification to cure the intermod problem
and got it back yesterday. They did cure the problem. There
is no intermod at all on one repeater that I was previously
getting killed on. There is also a noticeable improvement in
the sensitivity out of band on the weather frequencies.
Though my radio is almost 2 years old they did the work free
of charge. I tried to have them send me the parts to do it
myself but I couldn't talk them into it.

Attributed: rogerm@hpfcso.FC.HP.COM (Roger Mitchell)

-=-=-=

the other to produce an in channel response. For example say there are two repeaters on 146.88 and 146.82. These two frequencies will develop 3rd order products at 146.76 and 146.94. Tuning the receiver to either of these frequencies you would hear both conversations at the same time (assuming their signal levels were high enough to cause the intermod).

A spurious response results when a single input signal, at a frequency other than the desired receive frequency, mixes with the first LO to produce an output at the first IF. For instance suppose that I am tuned to 145.21 MHz and my first IF is at 21.7 MHz (as is the case in the 470). My first LO is 21.7 MHz above 145.21 MHz or at 166.91 MHz. A signal at 156.06 MHz will generate a spurious response at 21.7 MHz since 2*166.91-2*156.06=21.7 . Thus the second harmonic of the LO mixing with the second harmonic of the spur frequency ends up in the IF. Just how susceptable the receiver is to this spur product depends upon the design of the first mixer and the gain and linearity of the preamplifer, as well as the ability of the input filter to reject 156.06 MHz. Since the VHF front end is fairly broad, the filter will do little good.

I suspect the IF frequency change in the 470 occured as a result of spurious problems, since the IF frequency should not affect the intermod dynamic range. In fact, another ham in the area brought his 470 over and we checked it for its intermod performance and it was identical to mine, however his had the original 17.3 MHz VHF IF. Thus I guess my performance is typical. From email I have received since my original posting, it appears that this type of performance is typical for dual band radios made by all of the major manufacturers.

(Continued from previous message)

You can hear the second LO frequency with a general coverage
receiver in SSB mode. As suggested by Al Rabassa, wrap the
FT-470 with several turns of insulated wire and connect the
wire to the antenna connector of the GC receiver. The 2nd LO
frequency should be received.

You can also hear the first LO with a scanner. The first LO
will be at a frequency equal to the FT-470's displayed
frequency plus the IF frequency.

Another way to tell is to hook up a spectrum analyzer to the
antenna input (Be careful not to transmit!!!) and look at the
first LO leakage. It is very easy to see on my radio (about
-50 dBm). The first LO will be offset from the receive
frequency by the first IF frequency. At 144 MHz the LO will
be at 165.7 MHz. For receive frequencies above 157 MHz, low
side injection is used.

Attributed: Jim Summers, KD7F

-=-=-=

4. Yes, a frustration level will occur, but then success will
appear as the glue gives up after a few minutes.

5. Make a note of where the wires attach to the battery and
thermal switch. Also note the pack orientation.

6. Connect the replacement pack into the case and attach the
wires per your note in step 5.

7. Close the pack, charge the cells, attach to the radio for
a test.

8. If satisfied, place a spot (1/2 inch dia) of clear RTV on
each side of the cell pack and press the case together and
place it under a weight for a short time until the RTV
cures. Because of the reduced amount of glue, the case
will have a more flimsy feel than previous to replacement,
but will perform like the original.

9. For the next replacement, the RTV will give up much easier
than the original glue.

(Note: the receive only ranges are enabled by powering up the unit with the up and down arrow buttons depressed...kjm)

When there is more than one combination which has the same frequency range, the difference is the default step size and/or the default repeater offset. Of course, choices that do not match the VCO and filters do not actually transmit or receive on those frequencies. A particularly strange example is that the VHF side of the set can be set to tune from 404 to 444 MHz, but again, it won't actually lock. Even in the 101-141 mode, the VHF VCO will not lock - this must be for use with some other sort of VCO (It looks like this would cover the aeronautical band rather nicely.) There are two really wierd VHF settings, those for 8AL-242 and 1R3-158L. These must be for use with some other LCD controller - it displays truly unusual and non sequential thins when stepped through the "bands".

R74 seems to have something to do with selecting the IF frequency, or something similar. When set, it really screws up the VHF reception.

My technique for determining these straps is to remove the straps that come in the unit, solder wires to each pad, run the wires out of the unit to a bank of DIP switches, screw the unit back together, and then go through all of the DIP switch combinations. I usually use a stereo microscope and 30 guage wire for this. Since I didn't try powering the unit on with every combination of keys held down for each DIP switch combination, there may still be other secrets possible.

I was looking for something like receive and transmit from zero to infinity, but I didn't find it. I determined, from studying the schematic, that there should be a hiddem strapping diode from CPU pin 2 to CPU pin 22. I installed

one, but nothing changed. In fact, changing it and powering
the unit up did not cause a reset. Therefore, I concluded
that this really wasn't a mystery strap, afterall. However,
there could be others. I'm trying to get a data sheet for the
CPU, from Hitachi, to see if any of the grounded pins are
actually I/O pins -- they might be good candidates,
particularly if their traces are routed in such a way as to be
easily accessible for cutting.

I've learned that one of the ways to get some of the other,
new Yeasu handhelds to go out-of-band involves dumping data
out of the clone port, editing the data, and then dumping it
back in. I called Yeasu and asked if the FT-470 could be
cloned. They said no, so I ignored them. I haven't figured
out how to get it to dump data, but I believe it will accept
data. The clone mode is entered by powering up the unit with
the F key held down. (It's also a neat way to see all of the
indicators on the LCD!) The data must be presented in the
ring ("right channel") of a stereo 2.5 millimeter plug which
is placed into the mic jack. This is cryptically marked on
the schematic, anyway. However, I have no idea what the
format for the data should be. If you come across this, I'd
love to know. This may be the trap door to getting the rig to
receive and transmit in more interesting places.

VHF Transmit mod:

Effect: Enables extended VHF transmit (this is exactly the
same as one of the previously listed mods).

1) Open the radio such that the two halves open like a sandwich.
2) Locate the internal lithium battery
3) Locate several solder pads to the left of the lithium battery.
4) Just to the top left of the lithium battery is ONE vertical
solder pad (a.k.a. R69). It is almost under the top left
edge of the battery.
5) solder a jumper accross this pad.

Result: Extended VHF transmit

Bugs: The automatic repeater shift (- offset below 147,
+ above etc...) goes away with this mod.

Yaesu FT-470 MODS
Rev D (Aug 28, 1992)

This is a collection of hardware and software mods for the Yaesu 470. I have collected every mod seen on the net (ie. Usenet) since the introduction of the 470, so I think this list is fairly complete. I am interested in getting updates and corrections to this list, so please send me e-mail if you find something that needs updating. (This includes typos, wrong or missing attributions, caveats, warnings about unmentioned side effects, serial numbers of radios that won't do some of these mods, etc.)

This advice is free, so remember that you get what you pay for.

Brian McMinn (brian@nucleus.amd.com)
N5PSS
512-462-5389

-=-

Full Reset:

Effect: Severe! :-)

1) Make hard (paper) copy of all memory info
2) Turn radio off
3) Hold down VFO and MR and turn radio on
4) Replace all memory contents

Notes: This will reset the auto repeater offset function, so you will need to re-enable it if you use it. This will also disable (mask) all memories except #1, so you will have to enable each of them by hand.

Attributed: Yaesu

-=-

MARS Mod:

Effect: Enable extended 2m receive, 2m transmit

1) Make hard (paper) copy of all memory info
2) Turn radio off
3) Hold down up-arrow and down-arrow and turn radio on

4) Replace all memory contents

Notes: This mod wipes all memory contents. This is a "toggle" mod in that it can be un-done by repeating the above steps. The normal->MARS mod only wipes the memories. The MARS-> normal mod not only wipes the memories, it appears to do a complete controller reset (see above).

Result: Receive range 130-180 MHz, transmit 140-151MHz (I think, I haven't tried it.)

Attributed: Yaesu

5099. IC-2410H questions-Pls Help

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-05 00:00:00 UTC
From: dddavis@mindspring.com
Message-ID: <dddavis.9.001E4C70@mindspring.com>
Source record: 209492

Anyone familiar with the Icom 2410H 2m/70cm radio: I would appreciate advice.

I just purchased a used 2410H (says Limited Edition on the faceplate, if that matters). One of my reasons for buying this radio as opposed to the Yaesu models I am more familiar with is the availablility of remote DTMF control for cross-band repeat operation. This radio has the speech board, the DTMF decode/control board, and the tone squelch boards all installed.

From the DTMF remote (HT), I am able to access the radio, change frequencies, and enter the corss-band repeat mode. However, I am having several problems which may be due to my lack of familiarity with the radio and the lack of detailed information in the manual. Here are the problems:

1. In DTMF remote mode, the speech function (frequency read-back) seems to have no effect. This function does work in normal mode or via DTMF control mode with the mike attached to the radio. I expected the frequency to read-back over the air. I tried "C" and "DC" per various instructions. Am I doing something wrong?

2. When I enter cross-band repeat mode, I can no longer control anything until I exit that mode. Is this normal?

3. When I enter cross band repeat mode, "L" indicators blink on both sides of the display (VHF and UHF). This is not the standard low power indicator, but the radio does seem to be in low power mode when this happens. (I am not able to bring up local repeaters which I can access normally.) Since I have no radio control functions while in x-band mode (see #2), I cannot set power to high. The radio seems to default to low power mode in x-band, no matter where it is set before that.

4. Also when I enter x-band repeat mode, the main channel frequency reverts to where it was when I entered the DTMF remote control mode. For example, if the 2410 is set on memory channel 3 when I go into remote control, I can use DTMF commands to set channel 4 (display shows "ch 4"). As soon as I enter x-band repeat mode, the display changes back to the frequency for channel 3.

5. After I enter x-band repeat from the DTMF remote, I cannot regain control of the radio locally. I must exit cross-band repeat from the remote before the front panel access works again. Is there a way around this?

Well, that's a lot of stuff. Any replies are appreciated. I have a short time to return this radio to the guy I bought it from if I
can't resolve these issues. I may buy the IC2350 in that case. I hope the problems are just due to my lack of knowledge, though. Thanks in advance for any replies.

More current than regular alkalines? I don't think so. I can run my camcorder just fine on regular alks, but it won't even start up using a fresh, brand-new set of Renewals. And they won't run a pocket TV anywhere nearly as long as regular alks. In my experience, Renewals have about the energy of a "heavy-duty" type carbon battery, not an alkaline. They do take a charge well, though, and they don't self-discharge.

5103. Computer noise..... HELP!!!!

Source record: 209496

Got a new FT-990 and my computer kills it. This is what Ive tried -
1.ferrite split beads on all cables comming out of computer.
2.disconnecting all cables from computer.
3.large ferrite ring on power cord to radio and computer.
4.ferrite split beads on cables inside computer...power to main board, power to hard drive, wires from main board to lights and controls on front of computer.
5.aluminum foil inside computer case then putting on cover, then putting more foil on outside of case.
6.putting ferrite split beads on antenna cable.
None of these worked.What worked was:
1.turning off computer
2.disconnecting antenna from radio.
i think the noise is coming from the computer power supply. If anyone has any suggestions I would appriciate the help.This is driving me crazy. Thanks alot de Mike/KN6VS

The Nyquist frequency is only necessary to sample and replicate the original signal with accuracy. What many people are not aware of, is that it is not necessary to sample at Nyquist rates for communications audio. When we refer to a 2X sample, we are generally speaking of high-fidelity applications.

Undersampling has been used by the U.S. military with great success for many years.

For sale: Drake TR4-CW/RIT in MINT condition.

Only about 10 hrs use since factory recon.
Rig looks and works great. It was/is my
back-up, but I never need it and am not very
active, so I will sell it for $350.00

It has 500Hz CW filter, all 10m crystals.
Comes with AC-4 P.S., and MS-4 spkr.
You pay shipping, etc. from North Texas.
Email me at: donw@why.net

5108. QSK...

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-05 00:00:00 UTC
From: fitr%mimi@magic.itg.ti.com
Message-ID: <4a16ok$h6p@tilde.csc.ti.com>
Source record: 209501

Well, after reading all the posts on the success and failure of QSK in
the Icom 706, I thought I'd put out a little information on the Alinco DX70
since this is also a small sized rig.

1. The Alinco does NOT have a vox circuit, so any QSK keying seems to
be keying the T/R relay which is the same relay used in SSB or FM/AM.

2. The rig (with the outboard amplifier keying relay still disabled) did
emit a pretty loud clickety clackety sound when keying. It was loud
enough for the XYL to ask what I was doing anyway.

3. The keying waveform was not monitored via 'scope, but I did have another
HF rig nearby for note / tone monitoring. I ran tests at various "guestimate"
words per minute and noted the QSK quality. Here are results:

below 20 WPM : No problem. QSK was fine with good in-between AGC response
and recovery. No difference between QSK and semi breakin
except for the little TR relay clicking away. Sidetone volume
tracked nicely with af volume, making the sidetone about the
same level as the in-between received audio. OK QSK.

25~30 WPM (a comfortable range for most dedicated CW ops) QSK keying relay
really clickey but the rig did not chop much of the intermediate
dits. Keying (dash-dot ratio) was standard 2:1, using a curtis
8044ABM chip and "default" keying characteristics. CW note was
fine...no problem to copy and almost unnoticable difference between
QSK and semi break-in.

30~35 WPM (typical CW Contest keying/exchange speed) QSK keying was a bit
chopped, but still easy to copy. During bad band condx, probably
would be ok but no longer a 2:1 dash to dot ratio. Using an
adjustable keyer with weight adjust would compensate for this and
rig would be fine.

35~40 WPM (typical for CFO, DXer, or the average UA0 Ruskie) QSK keying
chopped the first dit in part (dit was short) and keying ratio was about 1.5:1
making dash/dot distinction a little difficult with QSB/Fading
probably just barely workable

OVER 40 WPM : Pittiful...really stunk and would be useless if running split
band DX (ie RX on the USA 40M Phone subband, TX on the low end
of 40 CW subband).

As for general QSK, I agree that it makes little sense for a rig to be manufactured
without some decent QSK. I know the relays and TR switching can handle the speed,
especially considering we can manage 9600 baudot switching these days. While the
Alinco DX70 is Alinco's first, it's too bad the other "big boys" cant seem to add

decent QSK to their rigs. To the OM that posted his ranking of the QSK rigs, I think your rating was right on the money!

It would be interesting to have a side-by-side comparison of "cw performance" among all the mini rigs out there today, including the Yaesu 890/900, Kenwood 50, Alinco 70, and Icom 706. I wonder who would win!

Now the question: What's the best QSK combination you've run across? I find the Yaesu FT890 to be ok, but a far cry from a Ten Tec Omni D (oldie but goodie)!

To All,

I have an ICOM 737 about 3 yrs old and it is starting to act up. The symptom seems to make it look like an old tube rcvr. When first powered up it takes about 5 minutes to get the full band. I cant hear anything on the bottom 50khz of all bands. Sounds like one of the vco's not being stable, but not sure. Any help would be appreicated.

Re: my earlier message (text below), the question is "How many mistakes can one person make?" Most of these issues have been resolved as operator error. Questions 2 and 5 remain, if anyone could give advice. Also, does anyone know of a way to increase mike gain (or the equivalent). I am getting reports of good signal, but low audio unless I practically swallow the microphone and talk too loudly. I'll splatter all over when I switch back to the Yaesu in the other car if I do that too much. Also, is there a way to initiate cross-band repeat from the front panel rather than through the remote? Thanks again, Don (KE4KYO)

Noise will continue as a problem in Balanced or un-balanced feed systems
as long as the feedline thinks the household wiring is a great path for
RF. Keep in mind that everything in the near field will absorb and
reradiate RF energy no matter what type it is.

Use isolated outlets with known RF attenuation in the problem frequency
range. Tuner fed long wires are OUT!

Just a point about radials....

Any vertical antenna will operate with out radials. It just depends
how efficient a radiator you expect to have. Naval vessels have
operated verticals with out radials on shipboard installations for
years with excellent results. Of couse they have a lot of highly
conductive sea water under them. You just don't get the same
performance with rocky soil under them. Even the so called no radial
half wave antennas will work better with a goodly number of radials
under them. Capt. Paul Lee wrote an excellent book on verticles and it
was published by CQ Magazine. Capt. Lee has since become a silent key
but his book is well worth reading for an excellent education on
vertical antennas.

5115. Svetlana Tube Experience?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-06 00:00:00 UTC
From: James Garland <garland@ohstpy.mps.ohio-state.edu>
Message-ID: <4a488b$qpi@pacific.mps.ohio-state.edu>
Source record: 209158

After reading Bill Orr's CQ Magazine article in which he raved about Svetlana 811As, I bought four of them from a ham on my DX Packet cluster who has access to them through his company. One had an internal short circuit, and another seemed to have unstable idling current. Also, they seemed prone to oscillation (in an old GSB-201 linear), so I'm wondering if the interelectrode capacitance and transconductance is the same as the domestic version? Curiously, the tubes were marked "Pride" in large red lettering on the side of the glass envelope, rather than Svetlana, although I was assured they were manufactured by Svetlana. Physically, they resembled the ones described in the Orr article, and had a 1993 date code. They were also stamped "made in USSR". Anybody had experience with this line of tubes?

On my 706 it opened up HF and opened up VHF only milliwatts, you don't
realize it is only milliwatts unless you measure it because the transmit
LED comes on. There is no power indication on the power meter though, and
there is very very little power output.

5123. Re: my FT530 battery pack is dead!!!

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-06 00:00:00 UTC
From: miltf@ux1.cso.uiuc.edu
Message-ID: <4a4d5d$3nb@vixen.cso.uiuc.edu>
Source record: 209261

The question about getting the FT530 battery pack apart. It can be a real pain!. The pack is glued at the seam around the middle of the outside edges. Sometimes a sharp knife will work, carefully cutting on the seam again and again until you get through the glue. Changing the batteries is no problem. Be sure to buy a complete set since some cells have gone bad, the rest will be going soon anyway. Most of the aftermarket battery dealers have the sets for around $15 or so.

Glueing the pack back together can also be tricky. You need to keep the orginal battery dimensions or it won't fit into the charger. Clean off the old glue and put new around the edges. Clamp it tight until it sets. File or grind off the excess around the edge.

I find the aftermarket batteries, WW in particullar, to be superior in life to the OEM. The WW batts are easier to open, as well.

After replacing some battery packs with new cells, I prefer to buy new packs from WW Associates instead of taking a chance of stabbing myself trying to open the old pack.

>PM or post - as you like it.

I just recently bought the FT-736R. I had my heart set on buying the
TS-790 but a friend of mine told me I should consider the 736. The
two advantages I see in the 736R is the optional band modules (222, 6
meters, 1296) and the built in power supply. The 790 does put out a
few more watts (45 compared to 25.) A 1296 module is also available
for the 790. From what I understand, both work great for the
satellites. When I bought the 736, I called 30+ stores to find the
best deal, and almost all of the salespeople said they sell more 736's
than 790's so it is a very popular radio. I also own a Kenwood 690S
that I wouldn't take anything for (really like the rig) which gave me
my interest in the 790. Anyway, I guess it just comes down to
personal preference because they are both really good radios. I hope
this helps.

Source record: 209264

We agree, replace *ALL* of the cells! At the TRW Swapmeet, replacement high-cap cells are $1.50 each, with metal solder tabs! I also found a used/dead high power battery for $10. I rebuilt that one too.

I've completed three, so far. The method I used to open the case is to wrap the body of the battery with a towel. I then placed the battery in a vice, where the jaws meet the weld ~ and gently tightened ~ listen for a slight 'crack'... It looked like this:

```
BBBBBBBBBB
Jaw------>BBB END BBB<-----Jaw
BBBBBBBBBB
```

Next, I gently tapped the weld/seam with a rubber mallot and the seam/case opens with ease. Works every time with no real damage to the case!

Use two wraps of scotch tape to hold the cells together. Another helpfull hint is to use a hot glue gun to re-assemble the two case halfs. Quickly re-wrap the battery and place the battery back into the vise and allow the battery case to reseal. Try to keep the fabric away from the seam/hot glue. I first tried three large ty-wraps around the body but the vise was better.

For mobile use, I got the original smaller case and mounted a three-legged voltage regulator inside, with heat sinc. That, two caps and a light duty cigarette lighter cord were all wired together. Presto! A tiny, battery-free, light weight mobile power supply that protects your radio from spikes and over-voltage.

Don't worry about any excess hot glue at the seam as it rubbs right off after it cools. Use proper caution when you dispose of the old cells.

Enjoy!

From: n4lq@iglou.iglou.com
Message-ID: <DJ61nG.AIB@iglou.com>
Source record: 209265

For those who don't want to cut the yellow wire, the pin can be left on the yellow wire and returned to its normal state later if you want to un-mod the radio. Simply unplug the connector. Using a paper clip, push in on the release pin on the side of the connector while tugging n the yellow wire. The pin will come right out. Now you may wrap a small wire around the neck of the pin, solder then tape it. Run the extension down to the vco point.

5128. Kenwood TM-221A malfunction

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-06 00:00:00 UTC
From: chasjesus@socketis.net
Message-ID: <chasjesus-0612950942170001@cl027.socketis.net>
Source record: 209266

I have a Kenwood TM-221A 2-meter mobile that has developed a perculiar problem. After the unit has been off for 15 - 30 minutes it forgets all of its settings (memory frequencies, etc.), even though I am sure it has an uninterupted 13v supply. It does this on the bench too. I have looked in the unit for a lithium battery but I don't see one.

Possibly a related problem: the LCD display has lost some of its contrast. The unit still transmitts ok, so I don't believe the problem lies with the car battery or the power connections, and like I said, it has the same troubles on the bench.

Any ideas??

Hi all,

I'm looking for a Windows logging program that in addition to logging functions gives a map display of other stations location, long path, short path, distance and gray line. I have recently downloaded the demo of Log View which is a pretty good looking log program but it doesn't give any map information.

Thanks,

Kevin

5131. ADMS-Software and programming FT-41 ?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-06 00:00:00 UTC
From: behrens@ita.fhg.de
Message-ID: <4a3jb9$nl4@news.fhg.de>
Source record: 209269

Did anyone try programming his FT-41 HT with the Yaesu ADMS-Software ?

My experience is:

Reading data from the HT is ok (it looks like in the programm-windows)

But...
Sending data to the HT caused a lot of trouble in my FT41:

- some memory-names are scrambled

- in one memory the "frequency" was 000.025 MHz (to low for 70cm, hi!)

- the display shows tone-squelch frequency and mode setting correct,
but T/T.SQ is not operating

-switching to memory 3 or 50 caused a complete "hang" (including the
power-switch!), the last solution was removing the batterie, and doing
a "master-reset" !

I tried the program on two different PCs, the version of the ADMS-Soft
is 1.20.

Did anyone try to write his own program for "cloneing" the FT41- it
seems to be a kind of 9600 Bd serial signal ?

By the way, what is the price for adaptor and software in the States
(60 $ in Germany) ?

Comments please in the newsgroup AND via e-mail to me.

I just installed 4 Svetlana 811As in a Collins 30L-1.
They work very nicely, no problems. They are quite
well matched also (equal dull cherry red in all 4
plates when max loaded). Two tone IMD tested 25 dB.
Cathode input VSWR very nearly 1.2 to 1 (measured).
Got them from Antique Supply, Tempe AZ.

From: aa0yt@mo.net
Message-ID: <4a4ktc$nco@Twain.MO.NET>
Source record: 209272

After mounting my 706 in the Saturn (the remote head is still floating about; not quite sure where to put it), I have noticed that the microphone cable is too short to attach to the back of the radio (under the seat) and that it's so short it drags the remote head all over the place. Has anybody tried making a "extension cord" for the mike: a pair of RJ45's, a RJ45 cable splicer (i.e., two females), and eight-wire phone cable? Seems like it would work physically, but I don't know about electrically. Any ideas?

While I've got your ear, has anyone noticed any problems running the 735 in coldish temperatures? The specs say it's good down to 14 degrees F, but I had some problems keeping the radio turned on last night after leaving the car outside for about three hours. The temperature outside was about 25F; inside was likely a little warmer.

BTW, Still looking for info on the Band Scope feature!

Thanks!!

- Goran Wallgren
- <>< - email: d2goran@dtek.chalmers.se //
- - WWW: http://www.dtek.chalmers.se/~d2goran/ \X/

I bought an FT-890/AT when they first came out. I think it has been
about four years now. I am extremely satisfied with it. I've had no
problems at all with it (that weren't my fault.) I did find out that if it
is stored for a lengthy period of time with the battery memory backup
turned off that the CPU may be confused when it is powered up. I
thought that mine was dead after being in storage while I remodeled
my shack. I called Yaesu, who was very helpful, and they said that all
I had to do was reset the CPU. I don't know why I didn't think of that!
After all it _IS_ in the manual!!!
I have used a TS-440 at ham fests and such and have a friend who
has one. I think that the FT-890 has better receive audio than the
TS-440, but I have never sat the two side by side for a comparison.
My '890 has never failed during operation, either in my shack or
field days, camp-outs.... Well, that's the FT-890 side of the story.
Maybe someone will give a TS-440 side.

Technology has improved things dramatically in the manufacturing of all electronics devices. When comparing prices of radios in the 60's with the price of radios in the 90's, the poster I responded to neglected to factor in the effect of advances in electronics and manufacturing technologies. It would take a dozen or more tubes to do what you can do with a single integrated circuit, at a substantially greater price, just as one example. I manufactured tube guitar amps for 7 years, and managed to pick up a few things in that time. Radios are much cheaper to make now than they used to be.

What the manufacturers seem to be doing now days is, instead of lowering the price, they add more features and keep the price the same. If they produced radios with the same level of features of those of the old days, they would again be much cheaper than they are. They might not sell, but they could be offered cheaper. We'll have to see how the bare bones MFJ 6 meter SSB rig does - I know I want to buy one. Look at what you can buy one of the QRP kits for! Amateur radios should not be as expensive as they are.

Remember the addage about adding up the price of all the parts in your car? Well, try the same thing with the parts list of your radio, only move the quantity break over two or three columns to the right. I think you'll find there's plenty of room for profit manufacturing amateur radios.

Amateur radio is admittedly a small market by comparison to some others. But by the same token, radios are relatively simple devices to manufacture when compared to VCR's and camcorders. And Kenwood already does make a

fair number of other types of radios, and in extremely large quantities; stereos, cellular and cordless phones, for example?

Wholesale distribution within the amateur radio market also has a negative effect on pricing. Several distribution centers across the country, each adding a cost factor. Lots of mom and pop stores, each of which buying only a few units means a more complex (and costly) distribution system. But there are large chains, each of which buys in fairly large quantities. There should be a greater differential in pricing between the large stores and the small ones. But the manufacturers are not providing discounts that are in proportion to quantity to the large chains. This is good and it is bad. It's good because mom and pop can stay in business selling radios to us; it's bad because it keeps the prices up.

IMHO the price of amateur radio equipment could be lowered, but we may not be giving the manufacturers much incentive to do it. Were just paying the high price, and then sitting here trying to argue why we *should* be paying the high price.

Source record: 209278

I believe what we're seeing here is price stabilization through the addition of features.

Let me explain.

Profit is the difference between what an item sold for and the total cost of selling it. In a highly competitive market like grocery items or home computers the margins can be quite small. Customers are fickle and will drive across the street or across town to save $10. If a producer wants to remain in business he'll have to remain competitive.

If the price to produce something goes down then the profit goes down. (I know that doesn't make sense. Read on.)

If the amateur radio manufacturers were to make a simple ham band only radio that was a solid state equivalent of those rigs of yesterday they'd probably be able to make them for very little money. I have no idea how much but an AM/SSB CB radio can be manufactured for under $100. If they work on a 20% margin that radio would sell for $120 and the profit would be $20.

If they were to put in $1000 worth of bells and whistles it would cost $1100 to make and with a 20% markup, it'd sell for $1320 for a profit of $220.

Back when color televisions came out you could get a nice one for about $350. Today a nice color television costs about $350. The price (and profit) has been stabilized through addition of features like remote control, automatic color correction, automatic find tuning, stereo sound etc.

Does anyone have a review of the Icom IC-735? My uncle has one and I think the radio is a good performer. I'm interested in getting back into HF again, but don't want to spend too much of a fortune doing it. The main reason I was thinking of going Icom, is the service center is right here in Washington State, I would more likely get something wrong fixed here than way down in California for Kenwood.

I mainly want to operate the digital modes on HF like CLOVER, AMTOR, RTTY etc.

Please E-MAIL, the newsgroups server hear has a low amount of space, so threads might disappear before I can see a follow up reply to this newsgroup.

Thanks & 73's

Does anyone have comments on the Alinco DJ-G5T dual-band (2m/70cm) handheld? From reading a description, it looks great to me. Earlier, I didn't realize that it has a backlit keypad and a microphone down low (good for full duplex).

So, if you have comments, like perhaps in these areas, please reply or post!

- Are batteries (for the DJ-G5T) available from any companies besides Alinco?

- How does battery charging work -- do you charge the pack when it is disconnected from the radio, as with the DJ-580T?

- How about any neat undocumented features? The DJ-580T has a really neat undocumented feature -- its DTMF sending speed can be adjusted to be VERY (and I mean VERY) fast, by using the #123 code successively for each slower speed, to cycle between the 16 speeds) after F-PL/FL (as with the documented #508 code for entering cross band repeat mode). I wonder if the DJ-G5T's DTMF sending speed can similarly be adjusted. I wonder if the DJ-582T even has this really cool feature like the 580 does.

- The extra PTT button for the "other" band sounds neat.

- I have seen differing memory capacity numbers. One description said "80 memories", while another said "100 memories for each side" (for a total of 200, I guess). Which was correct? I guess I should ask Alinco, too.

- Do people like it, and has anyone had problems with it?

The biggest problem with my DJ-580T is that it is now all alone somewhere in the bushes up in the Wasatch Mountains. :-(

Let's get some DJ-G5T discussion going!

Oh, and I don't suppose it has a 9600bps data jack, does it? I don't know of any handheld that does, darn it.

Best Regards!

There are a couple of marine communication companies that are using
Clover with what appears to be the PCI-4000 card. Their ads make ref-
erence to an external "modem" for laptops and other PC's that cannot
accomodate the large card. This DSP-4100 must be it. What I found
interesting is that these commercial services use data encryption so they
cannot be monitored.

From: MUENZLERK@uthscsa.EDU
Message-ID: <01HYHMLQECG200DMXW@uthscsa.edu>
Source record: 209288

My only suggestion is to put the antenna(s) as far from your computer/shack as possible. That is the only way I was able to cure my computer noise problem. Also, make sure that your rig is grounded well. Be sure that your cables (video, printer...) are of the shielded variety.

Their WEB site is <http://www.kenwood.net> however, their BBS, where most of their service bulletins are is at (310) 761-8284 (Los Angeles area).

As I recall, a lot of "wierdness" with the TS-120/130 series relates to bad grounding on the final amplifier and IF boards.... usually unscrewing the boards and re-tightening (as well as checking any grounding wires at these points, removing corrosion, etc) will solve most of the problems.

Yes Jack this is becoming a common practice. The Japanese Manufacturers are suffering from escalating labor costs. To address the problem they have turned to outsourcing. The Chinese are extremely cheap sources of labor at the current time. Several of the Pacific Rim Countries are suffering from the same ills they inflected on outers when they had cheap labor. What goes around comes around or so it seems. Look for the Koreans to do more outsourcing to China as well. Other nations such as Thailand, Malaysia and the Philapines are gearing up to be low cost high tech producers. The era of captive markets for mass production are slipping away. Even Vietnam wants to be a major player in the high tech area. This is the reason they want to be our good buddies now so they can gain access for high tech manufacturing and info systems work. The Indians have done a remarkable job in securing software development contracts. They write one hell of a lot of code in India for transfer to software houses.

From: n4lq@iglou.iglou.com
Message-ID: <DJ7wqI.9C5@iglou.com>
Source record: 209105

It is as if they had to WORK at it to make qsk this bad. My Kenwood
TS-940 has been tested for qsk above 100wpm showing no effect on keying.
The Ten Tec Hercules amp I use has a loud, large, reed relay for keying
the final. It follows my keying to 50wpm with no noticible effects at all.
The problem with the IC706 is that there is no weight adjustment for the
internal keyer. It does have a "ratio" adjustment which indicates a range
of from 2.8 to 3.?.... If 3:1 is the proper ratio, whats the deal with
that Alinco rig and 2:1 sounding so good?????
But ratio isn't the key factor here. Even if the ratio is correct, if
your dots and dashes are clipped, it still stinks.

You may be more limited by the ADC sampling rate. I think the military
is using saphire substrates to implement complete digital IFs. Under
that scenario, additional DSP functions are free.

5170. Wound Care & Pulsed HF High Peak Pwr Electromagnetic Energy

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-07 00:00:00 UTC
From: tgriff@ix.netcom.com
Message-ID: <30c77baa.9666964@nntp.ix.netcom.com>
Source record: 209108

This week I attended a presentation by representatives of the Diapulse Corp. The topic was "A New Approach to Wound Healing with an Accelerated Wound Care Program." The treatment is accomplished, according to their literature, with equipment that operates at 27.12 MHz, pulse repetition rate of 80-600 pulses per second, 65 microsecond pulse width, power range per pulse between 293 to 974 watts, duty cycle between 1/2 of 1 percent to 3.9 percent, square pulse with rise and fall time less than 1 percent...

During the question session I asked

Q: Is the power supply solid state or tubes?
A: Tubes because there is no solid state amplifer which can accomplish what the tubes can.

Q: There has been information that some hospitals no longer allow cell phones on premises due to reported interference with telemetry transmitters and receivers and infusion pumps. Does this devise cause interference?
A: No, cell phones have an erratic transmitting pattern and this devise does not. [then some comments about cattle, cancer and high tension electric lines]

I am seeking opinions regarding the specifications and comments regarding the above answers provided to my questions.

TIA

Tom Griffin

It's possible to obtain replacement nicad 'cells' for the BP battery packs, at 'significantly' less cost than the cost of an entire 'new' pack from Icom. . Look in the back of any ham magazine for an ad from 'Mr Nicad' in wisconsin.

Thought the packs came apart with a coupla screws (or am I remembering the wrong 'pack') ?

You've got some nice coax,Bob, worth over $1/foot. RG-142 is teflon insulated coax, with silver plated shield and inner conductor. It is 50ohm, and perfect for HF/VHF use. Teflon has very good voltage insulation and high-temperature properties, so I'd guess the power rating would be pretty close to RG8/U, and definitely much better than the comparable-sized RG-58/U. To give you an example, I use it to wind traps in my 160/80m inverted Vee, and routinely run a full-bore 8877 homebrew amplifier into them with no problems.

Only the very narrow WARC bands are covered fully. As you get down to 40
and 80 meters, bandwidths are about 25-35 kHz. An antenna tuner is
definitely in order.

From: "James A. Storm" <jastorm@ix.netcom.com>
Message-ID: <30C6A6A6.13C8@ix.netcom.com>
Source record: 209116

I've been using a TS-180S for about 14 or 15 years and never had a problem except for the power supply going out. I replaced that with an Astron supply which is better and cheaper. Sounds like by the time you buy a power supply for the TS-180 or a CW filter for the TS-830 you'll come out about the same price wise. Don't let the tubes in the finals on the 830 be the determining factor. They have advantages too as long as they're still available at a reasonable cost.

5179. Trigger page mode: FT530 vs FT10R

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-07 00:00:00 UTC
From: Jerry Kreifels <Jerry_A_Kreifels@ccm.hf.intel.com>
Message-ID: <4a7bif$smo@mcd1.fm.intel.com>
Source record: 209117

I have a question regarding the trigger page mode on the FT530 and the same mode on the FT10R.

Page mode is supposed to use DTMF tones to open the squelch on another radio. It is looking for a particular set of tones, and also sends that set of tones when you push the PTT button. In trigger page mode, it is supposed to quit sending (and needing) the DTMF tones after an initial exchange. As long as the space between transmissions remains less than 3 seconds, the tones are not needed. A longer pause causes the tones to exchanged again. The problem is the modes are different between the FT530 and the FT10R.

I have a 530, and my friend has a 10R. When we tried to use the trigger page mode between the two radios, we discovered that the 530 requires only 2 exchanges (A sends, B sends) before it quits sending and requiring the DTMF tones. However, the 10R needs 3 exchanges (A sends, B sends, A sends) before it drops the tones. This makes the modes incompatible between the radios. Page mode works fine, but not trigger page mode.

Does anyone know A) why Yaesu changed the trigger page protocol, and B) if there's some way in software or hardware to reconfigure one of the units to the other's protocol? I'd appreciate any comments. Thanks.

I have a FT726 and my best friend AA9DL has a 736. You definetily should listen to or talk to someone with a 790. Both of us complain about the poor receivers in these Yaesu rigs. If you have a strong signal on ssb during a band opening or contest the receivers in these rigs are trashed about 15khz either side of the signal. I know this is not a problem with the Icom 275 models. The receivers are really poor on the Yaesus in this regard. Good luck in your search. The Kenwood has the advantage of monitoring two bands at the same time which you can't with the Yaesu rigs.

Re: ICOM 706 Reports

I have had mine since the day before Thanksgiving and offer the following comments:

The radio basicly does everything claimed quite well. Past comments in this newsgroup are pretty much on target. The nitpickers will complain about high speed QSK, the tinny sounding speaker and a few other shortcomings, but on balance I believe that ICOM has created a radio that will see a very high level of market acceptance.

I am using my radio for auto and sailboat mobile operation and feel that it performs that task very well. I have no substantial complaints about the radio and would make the same decision again (in fact my brother went out and bought one the next day after seeing mine on Thanksgiving day).

If what you have is a USR "AUTO DIAL 212A", it is a bit of a collectors' item. To my knowledge, it was the first modem of its era to consolidate most logic and analog functions into microprocessors. I think it had 12 chips overall, including two cpu's (8080s?) and some rom. The nearest competitor was reported to have 44 medium scale integrated and analog-filter chips. This use of software to replace hardware was extremely effective at cutting production cost while maintaining high standards of performance and reliability. USR was launched competitively with this modem. Before this, USR was producing a 300bd acoustic coupler modem that was embarassing to look at, and not as fancy as an MFJ equivalent which I had (still do). The chief designer, I believe, was Steve Muka, a talented software whiz who tragically died after several bouts with brain cancer. USR evolved from a group of computer hobbyists and pros who were members of the "University of Chicago Computer Club" of 1975-77. It disbanded when in the spring of 77 the active members decided to form companies to produce various computer pariphenalia. Of the three corporations formed that year, only U.S. Robotics survived. Stan Metcalf, a corporate charter member with a taste for science fiction, named the company. Several years later he split with USR over some conficts, and formed Computex. Look up old Byte magazine ads to compare these companies products as of about 1979-81. It shows that you can start out slow and dumb and come out a winner, or blast out of the blocks as Computex did with a ground-breaking computer that might have altered the course of microcomputing as we know it. Too bad Pascal Engines did not catch on! Yes, that dusty old U.S.R. modem did for modems what Apple did for micros. K9ZAT

5183. Icom synthesiser problems

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-07 00:00:00 UTC
From: Martin Davies <Martin@amdavies.demon.co.uk>
Message-ID: <818295174snz@amdavies.demon.co.uk>
Source record: 209164

Several people have recently posted messages saying that they have had problems with the receivers in their Icom rigs such as the 725, 737, etc.

I have a 735 which is now about 6 years old and has for the last year or so suffered from an intermittent problem with the synthesiser which results in one frequeny range (8.000 to 14.999MHz) becoming virtually unusable at times. The symptoms show up as received signals becoming rough-sounding and at times disappearing altogether into a general mushy sound. It is most noticeable on Morse but SSB and even AM signals can sound pretty awful. A loud Morse signal on say 20m can sound several 10's of kHz wide.

The problem is caused by the VCO for that range (one of four) becoming excessively phase-noisy and at times causing the synthesiser PLL to lose lock altogether. I am reliably informed that the cause of the noisiness is a partial breakdown of the VCO trimmer capacitor, and that the cure is to replace the trimmers in all 4 VCOs. The components cost peanuts but it's a fiddly job to get at them; it entails removing the PLL board and then CAREFULLY unsoldering a metal screening can to gain access to the trimmers. I intend to replace them with professional grade components when I eventually get round to doing the job - at the moment the problem's not in evidence so there's no incentive to tear the rig apart!

Don't know. Did they have an overseas market; what was the exchange rate
; what kind of foreign marketing did they employ? If the overseas
manufacturers can sell here, but we don't sell there....advantage: foreign
manufacturers. Heathkit would have survived to this day, had it been run
more intellegently. As for the others one thing is certain, people
apparently did not want to buy their radios. (Irregardless of the quality
of the products - really too bad. You can make a better mouse trap, and
the world won't beat a path to your door.) Many American electonics
manufacturers fell by the wayside during the transition from tubes to
solid state. Maybe _their_ prices were too high?

The Japanese manufacturers have at least one distinguishing trait -
they do not put all their eggs in one basket. They manufacture other things
in addition to amateur radio and commercial equipment. A broad base is a
necessity to survive in the world market.

5187. Yaesu FT-11R question?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-07 00:00:00 UTC
From: killian@aztec.asu.edu
Message-ID: <4a715f$7tj@news.asu.edu>
Source record: 209168

I am interested in purchasing a VOX headset for the FT-11R. I just received some info from Yaesu on the VC-22 and noticed that it received PWR from the HT. I then looked at the schematic for the HT and noticed that the MIC connector was in fact a 'stereo' type (3 conductor) connector.

My question is this, I use a mic that was recommended by Yaesu now as the external mic (it is the mini speaker/mic). It has a 2 conductor plug for the mic. Why doesn't this short out the B+ in the HT? Am I missing something here? Should I continue to use this Mic? Could this damage the radio?

Any insight would be appreciated?

That was supposed to be a period not "?". I quess I got a little carried away with my questions.

Thanks

I sorta suspected that this might be an "undoable" request. Great idea, though! I've found if I leave the radio with the band scope display up (not scanning, however), and change the scale factor, I get one quick scan at that scale factor, and that's good for doing a quick check without missing much. I must say, I do like that the scan shows you where you VFO is tuned to with respect to the scan; nice for quick pounces! Thanks for the reply!

Greetings all.

I came across some coax which I cannot find info on.
Anyone out there ever see such a beast? And if so, what can I use it for.
Ohms? Freqs?

Here's whats on the jacket...

M17/60-RG 142 MIL-C17F 12814 THERMAX RG-142E

It's the size of the rg-58 and seems to have a silver-type center, with
a silver ground. I've got close to 500' of this. Since I'm gonna be doing
some tower work this winter (doesn't everyone?) I was wondering if i can use
it for HF/MF/VHF.

Thanks for any info.

I have in my posession 3 model RT-285 A / URC-11 rescue radios. This (for the uninformed) is a pocket-sized military rescue radio that transmits, receives and transmits a tone on 243 MHz. I have three options for using these radios:

1. Buy three aircraft
2. Get info on converting these to the 220 MHz amateur band from someone who's done it and find out what battery voltage(s) are required
3. Sell them to someone with more time on their hands, as these have been sitting around for quite a while.

Any offers for options #2 or #3? I tossed my latest Fair Radio flyer so I have no idea what these are going for these days.

shatter (ctbaker@burrito.engr.ucdavis.edu) wrote:
: What's the difference between a regulated and unregulated power supply?

A regulated power supply have logic that makes the supply voltage as
constant as possible. This is done by various techniques, but the
main tecnique is to have some amplifier after the fransformer that
compensates load and ripple.

```
---------- ----------| 7812 |------------
transformer | | |------|
| | |
---------- ------------+---------------
```

If the transformer gives 15 V for instance, the 7812 regulator makes 12 V
out of it. If you have a load the transformer voltage will drop, but the
regulator will try to keep it at 12 V. The standard 7812 will deliver max
3 A. Usually these regulators goes hot, so you need plenty of cooling stuff
on them.

From: cardenas@kaiwan.com
Message-ID: <4a7530$c93@kaiwan.kaiwan.com>
Source record: 209176

We agree, replace *ALL* of the cells! At the TRW Swapmeet, replacement high-cap cells are $1.50 each, with metal solder tabs! I also found a used/dead high power battery for $10. I rebuilt that one too.

I've completed three, so far. The method I used to open the case is to wrap the body of the battery with a towel. I then placed the battery in a vice, where the jaws meet the weld ~ and gently tightened ~ listen for a slight 'crack'... It looked like this:

```
BBBBBBBBBB
Jaw------>BBB END BBB<-----Jaw
BBBBBBBBBB
```

Next, I gently tapped the weld/seam with a rubber mallot and the seam/case opens with ease. Works every time with no real damage to the case!

Use two wraps of scotch tape to hold the cells together. Another helpfull hint is to use a hot glue gun to re-assemble the two case halfs. Quickly re-wrap the battery and place the battery back into the vise and allow the battery case to reseal. Try to keep the fabric away from the seam/hot glue. I first tried three large ty-wraps around the body but the vise was better.

For mobile use, I got the original smaller case and mounted a three-legged voltage regulator inside, with heat sinc. That, two caps and a light duty cigarette lighter cord were all wired together. Presto! A tiny, battery-free, light weight mobile power supply that protects your radio from spikes and over-voltage.

Don't worry about any excess hot glue at the seam as it rubbs right off after it cools. Use proper caution when you dispose of the old cells.

Enjoy!

Tony

Hi folks,

in another thread poeple are talking about the sudden death of several 2 1/1
year old FT530 battery backs and about the difficulty/impossibility of
opening such a pack. My batteries are now about 2 years old and it seems as
if I will have to expect their expiry sooner or later.
So I'm looking for some dead battery packs to experiment with. Maybe there is
a way to open them for battery replacement.
So if anybody had replaced a dead pack and has the old one dangling around,
please send me an e-mail.

Of course I'll post the resuls of my research!

I haven't called HRO's WATS line, but there in-store service has been good for me as a newcomer. All the folks in San Diego have been willing to talk and answer questions and steer me to things that I might like. I went there several times before I bought anything and asked about things I had read about.

I understand the point about phone service being not the best way to get good information exchange, but at this point, I'm pleased with HRO support and din't want them impugned by association.

Source record: 209181

I notice that when I "boot" my FT-40R pressing 'function', 'lamp', PTT, and down on the knob-switch I get some apparent default and status options. Looks like a signal strength calibration (inject signal level you want to represent "S1/9" and lock it in), set low med high max power levels, and something about squelch levels. A nice adjunct is that each adjustment is incremented 0-255, making the S-meter quite precise for field-strength monitoring, once calibrated to your requirements. What else can this mil-spec marvel do? What is the function of the "SFT #24 Yaesu service" dial-set that the manual says "keep this OFF"? Must be good! K9ZAT

Does anyone know of the mods that allow this radio to broadcast on the 220 mhz frequencies?

I've already done the mod to open it up for receive, I'm wondering if there is one for broadcast in that range as well.

FWIW, I've had my FT-736R for over three years -- have used it for terristrial as well as OSCAR contacts -- and I absolutely love it! I haven't actually put my hands on a TS-790, so this is more an enthusiastic user condition rather than a fair comparison!!! I have added the 6m and 125cm modules; they are also great pieces!

I had an ICOM 735 for a couple of years. Was quite happy with it and
the only reason I got rid of it was to upgrade to an ICOM 737. The 735 is a
good small rig, had no problems with it, just wanted some of the features of
the 737. Hope it helps you make up your mind..

The best reason for buying a Scout is the service. There is no way you are going to fix your Kenwood what ever rig it might be, an is one of the biggest reasons I sold my 450SAT. After your first Kenwood repair bill that $300 dollars between a Scout and a TS-50 that does not look so much now, will be a big pain later.

Ten Tec will try to help you fix the Scout over the phone and send you the part. Or even the board and bill you after you return the faulty board. You can actually work on it your self. If you have not found out yet, servace and parts avaliablity are everything.

Jim, WA7NDD.

: tom_boza@ccm.ch.intel.com

I have a TS-120S and installed a factory mod some years back. As I recall it consisted of about 6 diodes and possibly a couple of resistors. You should be able to get the mod directly from Kenwood.

The symptoms are that when you key the mic the ALC seems to cause the transmitter to go immediately to full output. This seems to be worst on the higher freq bands (especially 10 meters.)

5217. Help With SB-200 Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-07 00:00:00 UTC
From: jackl@pinetree.microserve.com
Message-ID: <4a8thh$51@crash.microserve.net>
Source record: 209198

A friend of mine has a Heath SB-200 amplifier and I'm posting this on his behalf. I suspect there's a problem in the power supply, but I haven't used this model so I didn't want to give him bad advice.

The plate voltage on his SB-200 normally reads about 2,700V. However, key down, it drops to about 2,200V. This seems like an excessive drop to me, but again, I'm not familiar with these amplifiers. He runs the amp on 220VAC, and after measuring a significant the drop on the AC line (I don't know what it was), he ran a new dedicated circuit directly from the breaker box. He now measures only a few volts drop on the incoming power when the amp is keyed, but the new line did not improve the plate voltage regulation.

My suspicion is that the power supply caps are drying out, but maybe those of you who have used this particular amp will have another suggestion.

Thanks & 73,
Jack WB3U

I understand that the 735 is no longer in production. What came out to
replace it? 738? and is it better?

I'm not sure the modem, like Hal's P38 would support FSK. I understood
most TNC's use Audio FSK through the mic connector.

5224. Re: RF interference in Ford Explorer

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-08 00:00:00 UTC
From: kr4ah@bga.com
Message-ID: <4a86h1$k0t@giga.bga.com>
Source record: 209118

The way Ford Technical Service Bulletins (TSB) seem to work
is that a TSB only covers a problem for 1 year. The TSB for the
fuel pump interference in 1993 is 93-15-6. I'm not sure of
any other year than 1995 (95-11-3).

In the computer index it can be found under "Fuel System"
"Noise" and "Radio".

I went to my dealer and asked about TSB 93-15-6, and was told
that it didn't apply to my car, a '95 model. A mechanic working
close by heard the conversation and asked if it was the RFI
problem and I said it was.

He then looked in the 1995 TSB to find the current number. I
asked him if he had done many of these and he replied that he
had done 276 in the previous year alone, and they were easy to
do.

It turns out that the 276 light trucks were for one customer,
the state, who had bought a fleet and wanted radios installed
in them. I don't hear the problem on my 2 meter-440 FM radio.
That might be because the antenna is mounted in the middle of
the roof.

I do suspect that it will show up on HF, though. It was
quite obvious on my previous car, another Ford. Since I
planned to trade in that car, I never did get it fixed.

My dealer seems quite willing to do the repair under
warranty. If not under warranty time charged will run from
2.5 Hours (88-91 Tempo) down to .7 Hours (91-95 Escort &
89-92 Probe). The filter is a really simple RFI filter
with two stubs (PN F1PZ-18B925-A).

I hope this helps.

So far haven't had any problem with the cruise control or any other systems in either this car or my previous car (1991 model). I did, however have the antennas mounted in the middle of the roof with an NMO mount and the radios were well grounded.

: FORD ARTICLE # 95-11-3 (portions copied here)

: A "Whinning/buzzing" noise in the speakers of the entertainment radio or
: two way radio on vehicles with an in-tank electric noise from the fuel
: pump.

: Correction:
: Install an electronic noise RFI filter (F1PZ-18B925-A) on the fuel pump
: inside the fuel tank. Refer to the following Test Procedure to confirm
: that the concern exists, then refer to the Service Procedure for repair
: details.

: Note: Some light trucks require one (1) RFI filter for each in-tank
: electric fuel pump on Mulit-tank vehicles.

: Test Procedure:
: Fuel pump radio noise is relatively constant and changes only slightly
: with vehicle speed. If the frequency of the noise varies or the noise
: comes and goes with the vehicle speed, then it is not the fuel pump and
: this fix will not be effective. The following procedure will help
: determine if the fuel pump is the cause of the radio noise.

: 1. Turn on the radio before the key is turned on (assuming the radio
: will operate without the ignition key. You may need to put the ingnition
: key in the accessory position).

: 2. Turn the ignition key to the RUN position (do not start the engine).

: 3. The fuel pump should run for about 1 second witht he key in the RUN
: position with the engine not running. Listen for the noise in the radio.
: If the noise is present while the pump is running and stops when the pump
: stops then the noise is being generated by the pump and this procedure
: should help.

: 1. Remove the fuel pump sender assembly from the fuel tank. Refer to the
: appropriate Service manual, Section 24-35 for cars/light trucks and
: Section 10-01 for compact trucks, for removal procedure.

: 2. ON vehicles without fuel delivery module, remove the negative and
: positive connectors from the fuel pump.

: a. Cut the wires to the fuel pump 3" from the flange of the fuel pump and
: discard the wires.

: b. connect the RFI filter connectors to the spade terminal on the fuel
: pump.

: c. Cut and solder both the red and black wire of the RFI filter to the
: red and black wires of the flange. Use shrink tube over the solder
: connections.

From: Randall Rhea <randall>
Message-ID: <4a8de2$mt2@news.informix.com>
Source record: 209120

I just bought a 706 and have a few questions:

1) The noise blanker does not work on AM. OK, I admit it, I listen to
CB channel 19 for traffic info on the highway. Is there any way to get rid
of pulse noise some other way? Would a DSP unit help?

2) I did the yellow wire mod. I still get very poor reception from
60 MHz to 129 MHz. 129 to about 170 is fine. All other freq's are fine.
I can only hear two stations on the FM broadcast band.

3) Any other mods out there? (I know of only two: the D59 and the
Yellow Wire mods.)

>it.

Hi Alan,

That's all true, but I want to re-enforce the diodes can't cause the exact problem Jack mentioned. If the diodes were defective and causing excessive voltage drop, they would immediately overheat and vaporize. Diode's are a self-eliminating problem. ;-)

If the amp has acceptable ripple (as I recall from design specs I received while working with Heath, the target ripple was < 5%) it is working correctly. The ripple will show up long before the voltage drop becomes excessive, and if it's caused by any defective component (other than the filter caps), the defective component will get VERY hot..

5229. Is Kenwood loosing it or what?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-08 00:00:00 UTC
From: ko4ta@mindspring.com
Message-ID: <4a9h93$vgg@firehose.mindspring.com>
Source record: 209123

Is Kenwood loosing their ability to manufacture solid equipment. I had a 440 a couple of years ago and it lost it's ability to lock the PLL. I found out that was a very wide spread problem and you had to have a major repair to correct it.

3 years ago I purchased 3 TM241a's (a 2 meter set) Now all three of them are dieing almost at the same time. The audio goes out intermittently and one of them has no CTSS tone out. And the LCD dispaly goes hairy intemittently.

Now I don't claim to be a rocket scientist but with me Kenwood has failed me 80% of the time. I have owned 5 Kenwood radios and 4 of them have failed. All of the failures have been wide spread failures that in my opinion should have been recalled. Everyone on the local repeater knows of the 241's audio problems.. They'll say, "... yeah mine did that too. I replaced the microphone." or " Yeah I had to send mine back for repair." Like I said these are wide spread problems.

On the HF rig, Almost anyone on the air can tell you to beware of a 440 (a certain serial number batch) because of this phase lock loop problem with the 440.

I am looking at the TS850AT but I can't get the courage to purchase it. Frankly I'm gun shy when it comes to Kenwood now. I certainly don't want to tie alot of my money up in a product that is bug ridden..

Anyone else having similar problems..... :o)

>improve the plate voltage regulation.
>
Remember this, the supply in the 200 is capacitor input. To accurately measure power line drop, use a **peak** reading line meter. The 200's HV is totally dependent on peak voltage, but most ac volt meters are RMS reading.

I had this problem with the ARRL lab years ago in an amplifier review. They had a big dollar RMS voltage regulator that made the line look perfectly stiff, yet the peaks were dropping a considerable amount and so was the HV. They blamed the amplifier supply, I blamed the power source. After they took the amp to W1AW and plugged it in the problem went away!

>My suspicion is that the power supply caps are drying out, but maybe
>those of you who have used this particular amp will have another
>suggestion.
>

If the caps were bad, the amp would have considerable ripple. That regulation is not out of line for the design criteria Heath used. About the best that can be expected if the designer *really* oversized components is 5% drop, while 12% is more typical with great care in component selection. That 200 doesn't (by the largest stretch) use "oversized" power supply parts, so the drop looks reasonable. My Alpha 77 drops from 4000 volts NL to 3000 volts under full load!

From: Gary <design@thereporter.com>
Message-ID: <4a8e64$jbe@miwok.nbn.com>
Source record: 209126

I suspect the difference between the "A", and "B" models of the MLA 2500 moght be that the "A" model was built with 10 meter coverage marked, and covered on the bandswitch, where the "B" model had no "MARKED" 10 meter position, but was fully wired for 10 meters and only required the moving over of a bandswitch stop to allow the switch to click one more "unmarked" position for 10 meter operation.
Not really much justification for pricing differential between either unit, condition dictates price, with a suggested range between $350-$450 for either model.

\
I just read your problem about Ford Explorer and HF RADIO interferrance.
I have a 1994 Ford Explorer and found the same problem when I put in My
HF. I had S9 noise from the fuel pump in the gas tank and partially solver
the problem by putting in a capacitor from the Positive line as close to
the tank as possible direct to the frame. I tried several different ones
until I found an Armaco filter designed for RF interferrance.
This reduced the noise to about an S 2-3. Still not being satisfied,
I wrote to Ford Motors Customers Service in Ontario. Believe it or not
they recalled the vehicle, removed the tank and installed a proper
RFI filter inside the tank next to the pump. No more noise except for
a slight white noise which is not even noticeable. By coincidence,
I found a write up in a motor magazine about the same thing but, I would
suggest contacting Ford directly and complaining about the RFI
on your Ham radio... good luck...

>Does D59 mod open up VHF on the IC706? If it does is the TX range 118-174 mhz?
>What is the power output over that range?

No. With the D59 mod, you can transmit from 1.6-54 MHz and from 144
to 148 MHz. No transmitting anywhere else. It appears that you can transmit
from 118 to 200 MHz, but the power output is only a milliwatt or so.

The 735 is a great radio, but for digital modes, I think you should look at
a radio that has FSK. Maybe an Icom 765 is available on the used market
at a good price.

IF THE 221 IS LAID OUT LIKE THE 231 AND 241, YOU WILL FIND YOUR BATTERY IN
THE FRONT OF THE RADIO. AFTER YOU TAKE THE TOP AND BOTTOM COVERS OFF,
REMOVE THE FRONT PANEL AND IT SHOULD BE ON THE PC BOARD OF THE FRONT
PANEL. YOU NEED TO BE VERY CAREFUL IF YOU MAKE THE REPLACEMENT YOURSELF
THAT YOU DONT SHORT THE NEW BATTERY WHEN INSTALLING IT.

GOOD LUCK

Mark-

I recall reading the same information about grounding in the TS-120S. The word was, that one should put star-lockwashers under all the screws, to insure good connection.

However, the repairman who installed the factory mod on mine, claimed that this is only partially true. He stated that the radio wouldn't go into oscillation, even with some of the grounding screws removed, if the factory mod was in place. When he finished with the mod, I never had any more trouble.

10% regulation sounds pretty good considering Heath's reputation
for being cheep in the iron department. If you have a way to
measure the ripple i'd look at it, but i suspect the problem is
with the power transformer. I doubt it is broken, just too small.

If you are a brave soul you can try measuring the resistance of
the secondary (BECAREFUL! There are a lot of turns on that
secondary. Just removing your ohm meter lead could result in a
shock, or spark and even a fried meter! Before removing the ohm
meter put a resistor across (or short them together) the
transformer leads!) You might also measure the primary R. These
two resistances are in series with the primary and the secondary.
The expected voltage sag in the secondary is at least as large as
((n*n*Rprim) + Rsecondary) * Isecondary. (where n is the turns
ratio... in this case roughly n=12)

My guess is you'll see at least half or more of the sag
attributible to the R losses. Knowing that Heath sizes the
transformer less than '100%' duty factor sort of implys the sag
during keydown is acceptable to them.
This is a crude guess, and there are obviously other factors like
leakage inductance and core saturation that might be even more
significant but at least you'll get a feel for the resistive loss
in the xformer.

An unregulated power supply will have it's highest voltage when there is
no load applied. As you increase the load the voltage will go down.

In the case where you are supplying a tranciever there is a small load
when you are receiving that changes to a large load when you transmit.

When you use an un regulated power supply you often have too high voltage
while you receive and to low when you transmit.

A regulated supply has circuits in it that are designed to keep the output
voltage constant regardless of load. Of course supplies are only designed
to supply so much current. If you exceed that the voltage will still drop
or maybe the power supply will shut it's self down if it was designed to
do so.

FT101EE : Cheaper version of E
FT101EZ : Cheapter version of E
FT101ZD : Not really a 101

I saw a 101F at a hamfest. What is it compared to the more common 101E?
Are there any other models that I haven't heard of?

Well, I'll add my 2.5 cents worth - I got a used TS120S that on arrival
oscillated just like the factory writeup said it would (20-10M unusable).
I confirmed that all of the electronic mods were completed (related to
some bypassing and rerouting of a wire), it still oscillated. At kenwood
factory their diagnosis was some loose fasteners. It's back now (with that
and a couple of other things fixed I didn't want to hassle with). Not a
major repair effort, but it seems that the star lockwasher idea is a good one.

I pruchased a Master II already converted to repeater operation. I have tuned it to my pair and both the receiver and transmiter work great. The problem is the when I try to use the at the same time..... Yes, I have a duplexer. The GE will take the place of an old Regency system. Does anyone have any hint or advise? With the both the transmitter and reciever in the same case I get a weak singal from the transmitter into the reciver. By tuning the receiver according to the GE instructions I get rig of most of the signal.

I have a second Master II that I want to convert as well. But, since the original rig was converted when I purchased it I have not information on how to do it. I am sure I can do it with out help but I am a HAM and therefore lazy. So, any help would be appreciated.

>supply) for $575. .... Anything pro or con about either rig would be
>good. Which rig would you recommend I buy? The 830S has tube finals so it
>requires contant tweeking.

I have an 830 and have worked other solid state rigs but not the 180. FWIW, I'm very pleased
with the 830. Here are some good points: built in supply, VOX, Speech compression, notch filter, IF Shift. I don't think the 180 has some of these, I may be wrong though. I especially
like the power output - depending on band, I get 110 to 150 watts out with the tube finals. The
180 is 100 watts as I recall. In marginal conditions, that little extra power can help. Many owners
of 830s receive reports of excellent transmitted audio.

On the negative side, it does require peaking as you tune the band. This isn't that bad once
you get used to it. It is only annoying if you are working a contest where you are trying to
keep up a QSO rate. But then if you get seriously into contesting, the 180 wouldn't cut it either.
You can't run it from 12 VDC, which is probably only important for Field Day, mobile, or emergency use, so factor that in your priorities. It does not have wide band continuous coverage on the receiver, only covers the ham bands. I think the 180 might have 2 - 30 Mhz continuous. That is useful if you want to SWL or eavesdrop on commercial digital modes.

Good Luck on your decision! 73 de Kirby N3MYB

08 Dec 1995 From Paul Nix (WB5AGF)
(e-mail: Paul_N_Nix@aud.alcatel.com)

ICOM-706 Technical Information
==============================
Purpose

I've been reading an awful lot the last 2 - 3 weeks about people modifying their brand new ICOM IC-706 radios. Having bought an IC-706 myself a couple of weeks ago, details regarding 'enhancements' to IC-706's have taken on a new interest.

It's clear that few, if any, hams have a schematic of the IC-706, and that's where I may have some useful information; I DO HAVE A SCHEMATIC (although a bit 'blurry' in some areas), and think that some circuit details may be of interest.

No ... I don't plan to provide a written description of the whole radio; there's a lot of the circuitry that I haven't even figured out what it does yet. What I DO have is some information relating to the 'front-end' filtering used above 60 MHz, and details regarding the synthesizer.

As I understand other circuit details, I may post more information.

Disclaimer

'The usual'; ie. use at your own risk, your mileage may vary, no user serviceable parts, etc. And no, I have no connection with ICOM, except for helping improve their 'bottom-line' with my purchase of a IC-706. I'm writing this 'after-hours', so my employer will 'disavow-all-knowlege' if you ask them.

Philosophical Ramblings

If the truth be told, I'm a dyed-in-the-wool Drake and Tentec man (I still have my R-4B receiver circa 1967, T-4X transmitter from 1970, and 1988 Paragon transceiver).

So why 'switch' you ask? Real simple (and I don't view it as 'switching', just 'adding'), the IC-706 is just too doggone 'neat' to pass-up. Where else can you hold an entire 100 Watt HF/6M rig in your lap, plus 10 Watts for 2 Meters? Laugh if you will, but I'm convinced the IC-706 is composed of 1 part 'Rocket Science' and 1 part 'Magic'.

They didn't tell me about this stuff when I was getting my EE degree back in the late 1970's (ie. the 'Stone Age').

Of course there is a 'down-side'. Whereas I can work on my Drake and Tentec gear, there's no way my pudgy fingers will ever have the dexterity (or my ageing eyes the clarity) required to do anything other than the most trivial surface-mount work. Looking at the IC-706's circuitry and I'm wondering "Is that a transistor?!". Robert A. Heinlein invented (far as I know) the expression "TANSTAAFL" ('There ain't no such thing as a free lunch'). With the stunningly small size of the IC-706 comes the shattering realization that I'm not able to maintain the radio (rats!).

Receiver Front-End Filtering, 60 - 200 MHz

The IC-706's receiver front-end filtering above 60 MHz is rather simple. Coming in from the antenna there's a low-pass filter, which's shared by the transmit signal path (I've done no calculations yet on that filter). After that we come to the following two possibilities.

When the radio is operating on the 2 Meter Band (144 - 148 in the U.S.) a bandpass filter is in-line. It consists of a two singly-tuned transformers, with a 0.79 pF coupling capacitor between them. (Can there really be that small a capacitor? Sounds more like 'stray' coupling than a discrete component, but the schematic shows it as an actual part) The schematic provides no tuning or alignment data, so I must assume that ICOM has the coupling capacitor, and transformer tuning, set for slight over-coupling, to produce a somewhat 'flat-topped' response across the 2 Meter Band.

ANYWHERE OUTSIDE THE 2 METER BAND (this only applies above 60 MHz of course), and the 'filtering' consists of a low-pass/high-pass filter combination. I'm certainly not a 'modern filter' design theorist. I can figure basic Poles & Zeros, but not much beyond that.

Several people have reported the IC-706's receiver sensitivity dropping-off rather abruptly up around 165 MHz. When I squinted really hard at the schematic (6's and 8's tend to blur together), and 'punched some numbers' into my little calculator, here are some of the figures that I got:

Coming in from the antenna, the receive signal hits a parallel LC pair (82 nH & 12 pF); I figure there's a Pole at 160.44 MHz. There are also 20 pF cap's, on either side of this section, going to ground, but I don't know how to 'handle' them. (Yea, I know it's some sort of Cauer/elliptic filter, but that's all)

Next the signal goes to a parallel LC section of 68 nH and 20 pF, that I believe produces a Pole at 136.47 MHz. There's either a 10 or an 18 pF capacitor on the output (leaving this LC section), but the schematic's too blurry to make out which.

Now the signal hits the high-pass filter section. In series there are capacitors of 24, 22 and 27 pF. Between the 24 and 22 pF caps is a series LC circuit to ground of 220 pF and 0.15 uH, although the inductor's figure is very hard to read. My calculator tells me that series resonance (a Zero) should occur at 27.71 MHz. Then, between the 22 and 27 pF capacitors, there's a series LC of 82 pF and 0.18 uH, which should produce a Zero at 41.43 MHz.

Logically, the result of this low-pass/high-pass filter would seem to be a response that falls off rather quickly somewhere a bit above 41 MHz (the upper of the Zeros in the high-pass section) as you move down in frequency, and somewhat below 136 MHz (the lower of the Poles in the low-pass section) as you go up in frequency.

Once the receive signal gets through either the 2 Meter bandpass filter, or the 'everywhere-else' low-pass/high-pass filters, it goes to a preamp, followed by a low-pass filter (I haven't tried to work-out its characteristics yet). It appears that it's right at that preamp that the 60 - 200 MHz receive signals 'meet-up' with the signal flow that's followed by the HF and 6 Meter signals. Those signals have gotten to the preamp via a completely different path, but I won't cover that now.

Some Very Simple Synthesizer Comments

The "yellow wire" modification, much talked-about, seems to have an 'advanced-option', where some brave persons have managed to pick-up a control voltage on a tiny surface-mount transistor on the synthesizer board. In the discussions on this subject, it appears that there is a misconception about what that transistor does.

The IC-706's synthesizer uses (among other things) two VCO's. The two VCO's can have either their direct output used, or there is also a frequency doubler circuit available. "VCO 0" (zero) is used on its fundamental up to 29.999999 MHz. At 30.000000 MHz "VCO 1" takes over, and is used up to 59.999999 MHz. At 60.000000 MHz, "VCO 0" takes over again, but goes through the doubler circuit. "VCO 0", with its frequency doubled, works up to 128.999999 MHz. At 130.000000 MHz, "VCO 1" takes over again, this time with its frequency doubled, and that's what's used up to the 200.000000 MHz upper-frequency limit of the IC-706.

Now, the output of these VCO's, either the fundamentals, or the first harmonic (2 X fundamental), go through a bank of filters (the IC-706 is 'oozing filters'; they're all over the place). Between 0.03 MHz and 29.999999 MHz, a low-pass filter is used. Between 30.000000 and 59.999999 MHz, another low-pass filter cuts-in. Between 60.000 and 128.999999 MHz a high-pass/low-pass filter pair is used. Between 129.0000 and 143.999999 MHz ...AND BETWEEN 148.000001 and 200.00 MHz another high-pass/low-pass filter combination is used. BETWEEN 144.000000 and 148.000000 MHz, a separate band-pass/low-pass filter set-up is used.

It is because of this mixture of synthesizer output filters that people have been able to find that transistor, to hook the famous "yellow wire" to. That transistor is one of several, that switch the appropriate synthesizer output filters in-and-out of the circuit.

101E?
>Are there any other models that I haven't heard of?

The "E", "EE" and "EX" are identical except for variations in the
items that were factory installed. The same owner's manual covers all
three models. I don't remember an "EZ".

According to my manual:

FT-101E - CW filter was optional. The factory cooling fan was
installed on models sold outside the U.S. and Canada.

FT-101EE - Identical to FT-101E but without speech processor

FT-101EX - Same as FT-101EE but from the factory did not include
coverage of 160m, 10m"a" (28-28.5), 10m"c" (29-29.5),
or 10m"d" (29.5-30.0). Factory cooling fan optional
regardless of destination.

In 1978, The E, EE, EX and F models were all being sold at the same
time. Oddly, the E and F versions had the same list price, $799.00.
According to the list of features in one small dealer ad, the FT-101F
was identical to the FT-101E. The features listed are:

160-10m coverage
Built-in AC/DC supplies
RF speech processor
260 watts PEP input, 180 watts CW, 80 watts AM
Solid-state VFO
VOX
Auto break-in CW sidetone
WWV/JJY reception
Heater Switch

Whatever the differences were between the E and F, they must've been minor.

>Thanks. --Bill KB8USZ pruth@alpha.cc.oberlin.edu

Generally speaking, the matching range of most tuners is not related to their price. The quality of components has a much greater impact, not whether a capacitor is 1,000pf VS 1,200pf. The same is true of roller inductors. The fact that it's a roller doesn't tell you much about its inductance, power handling or reliability. Compared to rollers, high quality air core coils made of large gauge silvered wire aren't cheap either, and a large HV ceramic tap switch for this use can easily cost upwards of $100.00.

Considering that nearly all commercial tuners now use a single-ended T-network, I suspect they're all pretty similar in their matching range. However, the only way to know for sure is to ask the manufacturer for the values of the three primary components.

Just let me give some more perspective to those of you who are
complaining about high prices on ham equipment:

A typical price for a Kenwood TS-450S/AT in the US seems to be
about $1300. Here in Sweden, the same station is about $2900!!
(With current exchange rates.)

We do have a 25% sales tax, but that can not be the whole story...

5274. re: Enabling TS-830S WARC Bands

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-08 00:00:00 UTC
From: Michael.Black@juxta.mba.org
Message-ID: <0a3_9512090930@mba.mba.org>
Source record: 209218

kb7et@usa.pipeline.com(Jim Sheffield) just got a Kenwood
TS830S and it won't transmit on the WARC bands, so he's
looking for the details to enable them.

The details of getting the TS-830S to transmit on the WARC
bands is easy and right there in the instruction manual.
Interestingly, I don't see the information in the service
manual. Anyway, the information below is straight out of
the instruction manual. The manual itself was still
available from Kenwood five years ago, which is when I got
my copy.

Probably, the disable was there in all of them, but
after the WARC bands came into effect, they simply kept
those diodes off the board.

It does leave me wondering where the rig was all
all these years that it wasn't used on the WARC
bands. I hope this helps.

Michael VE2BVW

----------from the Kenwood Manual-------------------
As supplied the TS-830S will receive but not transmit on the
3 new Warc Bands. If transmit capability is desired, a
minor wiring change is required.

1. For all 3 bands: Break the line between the RF unit
X44-1360-00, connector #6, pin #1 (TOF terminal) and
AF unit X49-1140-00, connector #6, pin #4 (TOF terminal).

2. Or, for individual bands: On the RF unit
X44-1360-00:

Band Remove (or Cut) Part
10MHz D4
18MHz D5
24.5MHz d6

------------------end------------

it's very regulated

>and b. can bend over the horizon.

true, but due to multi path propagation your maximum baud rate is pretty low
unless you are frequency agile and operating close to the MUF. 1200bd is about it.

VHF through microwave is needed for this sort of data rate, 56kb modems are
available for this for about $300 (I think)

>
>Does anyone know how possible, leagal and/or expencive is this project?

Well everyone wants one of these. They are starting to be off the shelf but
they're expensive in the kilo$ region I think. There's things like
personal computer communicators which send RF around a building at about
900MHz and if you put an antenna on them they go for about 2 miles.
I understand that companies have developed stuff at about 2-5GHz to do the same
thing. I'm hoping that ham packet will all go over to this sort of stuff
so we can have ethernet data rates on 10GHz.

5276. IC-706 Test Results

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-08 00:00:00 UTC
From: garland@ohstpy.mps.ohio-state.edu
Message-ID: <1995Dec8.095540.8559@ohstpy>
Source record: 209220

Here are the results of a sensitivity test of my IC-706 for 60MHz<f<200MHz, both for the unmodified radio, and after performing the "yellow wire" modification. I used a Wavetek 3002 sig generator, a Kay switched attenuator, and made sure all impedances were 50 Ohms.
Test Conditions: Mode-CW
Filter-wide
Preamp-Off

Signal levels in the table are the minimum level required to light the first bar on the s-meter. The minimum detectable signal was about 30-db lower than the indicated value. All signal strengths are in microvolts rms.

FREQ(MHz) SENS-ORIG SENS-MODIFIED
60 1.1 1.1
70 0.9 0.9
80 1.1 1.1
90 1.1 1.1
100 1.5 1.4
110 2.2 1.8
120 9.2 7.0
125 36 30
130 115 10
135 76 5.0
140 66 2.3
144 2.0 1.5
145 1.9 1.5
146 1.9 1.5
147 1.8 1.5
147.999 1.5 1.5
148.000 72 1.5
150 78 1.6
160 340 11.5
170 10,000 50
180 4,200 200
190 9,000 4,000
199 150,000 42,000

General Impression: Except for a slight decrease in sensistivity between 120-135MHz, the modified IC-706 has excellent sensitivity over the full frequency range, up to about 160MHz. Sensitivity rolls off sharply above 160MHz.

S-METER CALIBRATION:
test conditions: preamp OFF

freq:14.030MHz
mode: CW
Filter: wide

S-METER SIGNAL(uV)
S1 8.9
S2 9.5
S3 10
S4 11
S5 13
S6 15
S7 19
S8 26
S9 35
S9+20 35uV+20db
S9+30 35uV+30db
S9+40 35uV+35db
S9+50 35uV+40db

General Comments: The S-Meter is very poorly calibrated between S1-S9, with only a 17db difference required to turn an S1 signal into an S9 signal. Functionally, the S-meter is nearly worthless in this range, since its calibration is more nearly linear than logarithmic. For signals above S9, however, it is quite accurate.

Coming Soon: Results of selectivity measurements for the SSB and 500Hz filters.

Pricing Comments: I'll conclude with a small gripe. My XYL picked up the Y-adapter cord for me at the local ham store, yesterday, since the accessary connector on the back of the IC706 is a strange DIN-type connector I've never seen before. When she got home, I learned that the cost of the adapter cable was $45!!. In my opinion, Icom is gouging customers with this pricing schedule. I'd guess a reasonable retail price for the adapter cable (part no. OPC599) is aout $12. The power cord for the IC706 is $21, which is also far too high.

73,

Jim W8ZR

5277. Kenwood vs.Yaesu

I have all Ford vehicles here, and the pumps are noisy in all of them. I added external RFI filters at the fuel tanks by using snap on chokes and .1 MFD bypass caps from each lead to the chassis on the supply side of the choke.

I also ground the exhaust system, transmission and engine block to the frame at several points.

In my F-150/ F-250 vehicles, I ground the cab to the frame at all corners and the fenders to the frame at the front. The cab and front end sits on several rubber mounts to improve NVH (noise vibration harshness), but it causes ground loops in the wiring.

With these changes, I can run 1 kW mobile with no ill effects (except headlight dimming). The receiver noise dropped from S9 to S2 or less!

>Anyone else having similar problems..... :o)

Don,

I had an 850SAT for about a year (one of the first models) and had no problems. I sold it to a friend of mine and since that he had to send back the power supply (PS52 or 51 I think). The problem was only a loud fan. He then later had to send the rig back for problems with the anntenna tuner. Just recently he also had to send it back for a problem with the ALC. I have spoke with other 850 owners though and they are happy. Maybe it only happened to this early model? I don't know.

Since that, I bought the 950 and never had a problem. I then bought a FT-1000 and had problems with the SWR circuit making the tuner screw up. I then bought the FT-1000D since the 1000 never came out of the shop (had to have a rig!). I'm now buying (this week) the 850SAT again. I'm doing lots of CW and contesting. The 850 has what I think is the best features for contesting with a memory keyer as a standard toy. Have to get the optional filters for CW though. The Slope Tune just doesn't seem to cut it. I have even heard of guys buying the new 870S and then bringing it back to the shop being happier with their 850! This is _not_ my opinion - only what I've 'heard'.

I'm actually still debating wether to get the 870 or the 850. For the extra $1000 (cdn) for the 870, I can get all the neccessary options for the 850. What bothers me with the 870 is that you can't install filters at all. The DSP just have to work good or you're SOL. I have read several postings re this and think that I have to try it myself side by side with the 850/w filters.

Hope this and other opinions help you in your choice of rig.

: Jack WB3U
There is a string of diodes in a voltage doubler circuit in the power supply.
Over the time I had mine I had to replace many or at least once I replaced
them all. There are some high value resistors across these diodes to keep
the voltage drop in reverse equal.

There are much better diodes available today than there was when the SB200 was
designed. If you can get your hands on some good diodes I would say rebuild
it.
The caps could be going bad but I never replaced mine. I sold mine several
years ago. It was a well designed amp in it's day. Plenty of shielding etc.

On 6 Dec 1995, Val Breault wrote:

> I believe what we're seeing here is price stabilization through the
> addition of features.

"Features" in this case are in the eye of the beholder and are the bits of chrome and fins of the 50's and 60' automobile market. Who needs most of them? Or perhaps I should say that most people don't use them. A hundred memories? I guess they're analogous to the ten crystal sockets in the Viking II, but, resale value notwithstanding, if I had a choice of paying a couple of hundred dollars less, I would probably pass.

I proffer that to most, the "features" are like all those freeze frame and digital special effects bells and whistles on VCR's. They're good to get the buyer's attention, but have little practical value and don't get used much after the novelty wears off.

I have a little Icom IC-725 that is pretty bare bones by some standards, but it has the AM/FM board and with my JPS NIR-10, it is as good a rig as those costing twice what I paid for it (and more) five years ago. It makes my point very well however.

When I bought it, I also got the CT-17 level converter for computer control, but I have never used it. In the first place, there wasn't any software available at the time and when I got word that there was finally some available, it was another $130 on top of what I had already paid. The CT-17 has still never been plugged in. So much for those bells and whistles.

> the profit would be $20.

I haven't shopped the CB market, but I don't recall seeing an AM/SSB radio for under $100, but they are made in large quantities and they are still making almost the same radio they have been for years and there is probably very little spent for development or retooling. If the amateur manufacturers were to build an amateur equivalent of the CB radio with no fins and chrome, they could probably put out a nice rig for a reasonable amount.

But guess what! Somebody does. Check the QRP market and you'll find some superb rigs at reasonable prices. However, that's a parallel subject and not what we're talking about here.

> If they were to put in $1000 worth of bells and whistles it would cost
> $1100 to make and with a 20% markup, it'd sell for $1320 for a profit
> of $220.

Unless the "bells and whistles" involve a total redesign, adding them probably represents only a small additional investment. They are most likely analogous to the add-ons the dealer takes so much pleasure in selling you when you buy a new car. Big profits from a small additional production cost.

> Back when color televisions came out you could get a nice one for
> about $350. Today a nice color television costs about $350. The price
> (and profit) has been stabilized through addition of features like
> remote control, automatic color correction, automatic find tuning,
> stereo sound etc.

The dollar's buying power between then and now should probably be considered. The first television receiver my folks bought back in 1951 was an RCA Kent, a 16 inch B&W set that was about $400 which represented a relatively large percentage of what the average person was making back then.

It was expensive because (1) the demand was high and (2) they wanted to recover the high costs of putting them into production. Even so, I doubt that they made much or any profit for the first year or so.

Putting it in perspective, there was a story of when General Motors offered the Hydra-Matic automatic transmission into production in the late 1940's to the effect that they didn't make their first nickel of profit on it until the third year or so. I don't think that most folks realize how much it costs to put a new product into production.

I also remember the first color set I bought. It was in 1966 and the least expensive set I could find was about $500. It was as bare bones as they came with a metal cabinet and a round tube. Not great. Putting that in perspective, it represented about a month's pay at the time.

I'm oversimplified all this, but I hope I'm making my point that putting a new widget into production is expensive. It involves R&D, design, tooling up, training workers, acquiring suppliers and materials, marketing, distribution, etc. The list goes on. Frequently, little or no profit is realized in the first year or so on the learning curve. However, once the basic product is developed, fine tuning and adding bells and whistles is relatively inexpensive.

In today's world of advancing technology, much of what used to be made with labor intensive circuit boards is now available on single chips. That makes the same function smaller and less expensive to make, but the retooling, etc. is still there. It's a three steps forward, one step back sort of thing, but continue on down the learning curve and you find similarly performing products at lower production costs and ultimately less expensive to the consumer, thanks to competition. (Why pass those savings on to the consumer if you don't have to?)

OK, so you're now making a first rate product, but you have to keep selling things if you're going to stay in business because before long your market is saturated. So you come out with something "New! Improved!" that's really the same thing with different fins and chrome again. Obsolescence is the life's blood of the market.

In my previous post I mentioned the Drake TR-7 from the 1970's that you can buy used for about $600. True, in comparison to what you'll find today, it's big and heavy and uses circuit boards in the place of many of the integrated circuits you might find today, but will current production rigs perform significantly better to justify your spending four or five times that much? I don't think so, but that's an individual decision of course.

Lots of people spend years in universities studying this very subject, so I doubt that we're going to adequately cover the subject here. There are just too many complex factors at work, so the best we can hope for is to hit a few of the high points. In any event, I hope that this somewhat discombobulated and oversimplified treatise has helped put this subject in a little better perspective, or at least has planted some seeds for thought.

My friend's wife recently purchased him an ADI AT-200 HT for Christmas. We were looking through the manual and noticed that in the specifications it stated that its transmit range is 144.000 to 145.995 MHz. That's only half of the 2 meter band.

Does anyone know anything about this particular HT and if this is its true operating range. He really wants to open it and try it for hinself but she won't let him open it untill Christmas - BUMMER!

Any info would be greatly appreciated.

Following is a packet bulletin that appeared in W6-land on December 7th.
The author claims to be quoting from a memo from Icom with the "2 meter
extended transmit" mod information for the new Icom 706. However, the
range of the expanded VHF TX is not stated. (The MARS/CAP bands, perhaps?)

It is reprinted below: the numerous typos are from the original bulletin.

FWIW... 73 from Leigh/KM6JE.

From: NS1R@KA1TUZ.FN42JH.MA.USA.NOAM
To : INFO@USA

Hi, just got new info on the Icom 706 transmit mods from a 3 page memo from
Icom.If you simply want transmit from 1.8 to 54 MHZ then cut out diode #59
on the main pcb. You will see a row of them on the pcb main facing up near
speaker. If you want to restore the sensitivity of the receiver between 54
and 140 mhz and also from 148 to 200 mhz and also the out of band transmit
on 2 meters you have to also cut Diode #60 plus cut the Jumper wire next
to it called "W4". Then remove either Q38 or R353 from the main pcb
facing towards speaker. Then you have to cut a trace at point "a" nn the
bottom of the main pcb and install a jumper from piont "b" to Pin 11 of IC32.
You have to restore the out of two meter receive or you couldn't hear anyone
outside the two meter band to transmit back to.

"WARNING! BY RESTORING THE RECIEVE FROM 54 TO 140 MHZ AND 148 TO 200 MHZ YOU
MAY GET LOTS OF INTERMOD!!!!
i SUGGEST SIMPLY REMOVING dIODE #59 , RESETING THE PROCESSER AND ENJOYIN
1.8 TO 54 MHZ TANSMIT AND LEAVEING THE VHF PORTION ALONE!

>- Satellites

>- Microwave transverters from 2 m to 23, 13, 6 and 3 cm.

>- All modes...

>If you have any suggestion, experience or warnings for us, please write
>to this group or me, thank you!

I am an owner of an Icom 820H. I have been very please with it.
I would say that the 736R is a better rig for your applications. It
will give you more bands for the buck.

I use my 820H in a non sattelite role. If you want a fast switching
(keying) rig the Icom 820 can't be beat. It will do 9600 bd packet
right out of the box (I think packet stinks though). If you get an
820H your aplifiers mught not wotk so well because of the power
output. (not adjustable from the front faceplate.... internal pot to
adjust the 2 position switch on the face). I am told by those who
have 820H's that it makes a great sattelite rig.

what ever you get the bottom line is for an all purpose radio with a
great deal of expansion capabilities.... get a 736R.

Hope to work you one day.... 73 de Henry KC5FLJ... QTH EL17GT

5290. Help! Yaesu FT-51R Modifications?

Don't glue it! if taken apart carefully, one piece of tape on the top
of the pack (where the silver tape is originally) will hold it
together, and next time you'll only have to remove the tape. I have
been using 2 packs this way for over a year.

5292. Wound Care & Pulsed HF High Power Electromagnetic Energy

Apologies to those who have downloaded my posting twice. The initial posting does not seem to have made it to all of my ISP's servers "due to replacement servers and they're not being in synch with the rest of the array" or maybe my first posting went through the worm hole into the Gamma quadrant <g>. Nevertheless, your comments here or via email will be appreciated.

This week I attended a presentation by representatives of the Diapulse Corp. The topic was "A New Approach to Wound Healing with an Accelerated Wound Care Program." The treatment is accomplished, according to their literature, with equipment that operates at 27.12 MHz, pulse repetition rate of 80-600 pulses per second, 65 microsecond pulse width, power range per pulse between 293 to 974 watts, duty cycle between 1/2 of 1 percent to 3.9 percent, square pulse with rise and fall time less than 1 percent...

During the question session I asked

Q: Is the power supply solid state or tubes?
A: Tubes because there is no solid state amplifer which can accomplish what the tubes can.

Q: There has been information that some hospitals no longer allow cell phones on premises due to reported interference with telemetry transmitters and receivers and infusion pumps. Does this devise cause interference?
A: No, cell phones have an erratic transmitting pattern and this devise does not. [then some comments about cattle, cancer and high tension electric lines]

I am seeking opinions regarding the specifications and comments regarding the above answers provided to my questions.

TIA

5293. Old style Yaesu mic connectors now available again

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-09 00:00:00 UTC
From: rs@ham.island.net
Message-ID: <120995165455Rnf0.79b6@ham.island.net>
Source record: 209065
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Some time ago, someone posted looking for mic connectors to fit on the old style Yaesu FT-207R handhelds. These are a six pin audio connector, and I think were also used by Wilson, though I never had one of those.

I was browsing through a catalog I picked up recently in Vancouver, BC at RP Electronics, and lo and behold, there they were.

The part number is 359-100 for the mic cord plug, and 359-105 for the matching chassis mount jack. (The female end)

Prices were listed as $12.95 Canadian for the 359-100s, in quantities of 1-9, and $9.95 for the 359-105s in the same quantities.

RP is at 2113 West 4th Ave, Vancouver, BC, V6K 1N7, their phone number is (604) 738-6722, Fax (604) 738-3002.

I have no connection with RP whatever, but if some of you are still looking for these connectors, I suggest you give them a call.

I think if you compare the cost of radios today with 30 years ago, they are a bargain in real dollars.
Don't know if you remeber a Viking Valiant with less than 200 Watts output costing near $500 in 1962, or the early transceivers such as the Drake TR3, which cost over $500 in 1964. I suspect something like a IC736 at less than $1k is a lot better and a lot cheaper in actual hours of work to buy it.
These radios have less than doubled in price in 30 years. I get burned more about cars. Remember the $2500 new Chevy?
Regards, Al

Why 100 memories?

Well, in the SF Bay Area there probably are 100 2M/440
repeaters accessible from San Jose to Marin ..... If you
regularly travel to Santa Cruz or Sacramento there are certainly
100 repeaters available.
Also, some of us travel (e.g., to Washington, DC) routinely and
like to keep 2 sets of repeater frequencies in memory.

Yes it can. Romeve the top cover And locate a little green wire on the back of the control panel. Cut the green wire. put top cover back on. Look in the manual for the power on reset key combo. (I'm at work and don't remember it.....sorry.) Tx will be 138-174 mhz 430-470 mhz. Rx (also do the expanded rx key combo) 112-174 mhz 430-520 mhz. tx and rx in the vhf stuff holds spec great. tx in the uhf band drops to about 13 watts at 470. rx in uhf is about .5uv @ 12db sinad at 510 mhz!

If any one knows a mod for changing the band plan in uhf to tx higher that 470 please email me at manta@cybercomm.net

Don't be so cheap !!!! You got 2 1/2 years on a battery. Go out and buy a new battery from a dealer or an aftermarket company. This will keep you from carrying a 28 Ah battery on your belt.

5303. ICOM 2340H Question

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-09 00:00:00 UTC
From: perryn@ix.netcom.com
Message-ID: <30c98fc1.4721847@nntp.ix.netcom.com>
Source record: 209231

Just picked up a used 2340H. With the complexity of this unit and the uses that I hope to implement, I determined that I need a computer interface. Obviously, since the mic can control the unit via DTMF signals, I should be able to "patch" in a DTMF encoder to the unit's RJ-45 connector. The unit may not be able to report back to the computer, but that isn't necessary for this application.

The question is - does anyone know the pin out of the RJ-45 mic connector and the signal levels used?

Kenwood lost it ever since they introduced the 440's, 940's, etc. I used to repair amateur equiptment for a living and had many 440's pass my bench; too many for my liking. Most of them had problems that I attributed to bad engineering.

>I am looking at the TS850AT but I can't get the courage to purchase
>it. Frankly I'm gun shy when it comes to Kenwood now. I certainly
>don't want to tie alot of my money up in a product that is bug
>ridden..

I haven't personally worked on an 850 but I have heard good things from friends that have. They say that it doesn't seem to be riddled with the usual Kenwood bugs.

I'm running an old Kenwood TS-820S and I am very happy with it. The 850 was the only newer Kenwood that I was even interested in purchasing. The only thing that stopped me was the price.

Hi TIA

I designed and co-patented a solid state device that does what the diapulse device claims to do. I worked with scientists and doctors at Mt. Sinai in this area.

My design has a pair of MRF-150 FET's in the output, and is entirely solid state. It produces the required FDA rise and fall times, and the accepted FS levels with less than 20 percent of the Diapulses power requirements. They are "full of beans" if they claim solid state devices can not fill this application. Solid state devices can do this job, and do it much more efficiently than a 1950's tube type device.

Their device is technically crude, and has poor field confinement. One of the largest complaints with this type of device is interference to other devices. My applicator design cured most of that problem by providing a stronger magnetic near field with lowered electric and electromagnetic far field effects.

73 Tom
Are there specific questions you have about this type of device?

73 Tom

5314. ICOM 736 tone encode

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-09 00:00:00 UTC
From: elewis@dsp.com
Message-ID: <4acm13$p1i@news.wco.com>
Source record: 209242

I have a communications specialist te-64 tone encoder that I would like to add to my 736, but I don't know which connection to make in the radio. Has anyone done this. I know I have only one connection to make and it is on connector J33. J33 has 3 pins and one of them is ground so that leaves me a choice of 2 .One is labeled SBTN on the schematic and the other is labeled TONV .

5315. FS: Motorola 10 channel Radios

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-09 00:00:00 UTC
From: xaggerator@aol.com
Message-ID: <4acmnj$pip@newsbf02.news.aol.com>
Source record: 209243

For Sale:

BRAND NEW IN THE BOX
Motorola Sport Radios 10 channels UHF GMRS (General Mobil Radio Service)
Special Olympic Edition Blue w/USA Olympic logo
2 watts for a talk range of 2 to 5 miles
includes ni-cad battery and charger, belt clip, instructions, etc..

These are the "walkie talkies" you've always wanted. They work great,
perfect for hunting, camping etc..

Retail price for these is $249 (US) each
The Radio Shack version of these sell for $219 each
I'm only asking $199 (US) each and that's negotiable.
(sold only in pairs)
e-mail me at: Xaggerator@aol.com

5316. Schematic for IC-W2A

5318. Icom 706 modification list

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-09 00:00:00 UTC
From: 72336.3354@compuserve.com
Message-ID: <4abd4l$d95@dub-news-svc-3.compuserve.com>
Source record: 209246

```
ICOM-706 MODIFICATIONS
As of Dec. 9, 1995

SUMMARY
-------

MODIFICATION 1: Enables extended transmit from 1.6 to 54 MHz inclusive.
MODIFICATION 2: Enables extended receive from .05 to about 165 MHz inclusive.

CAUTION
-------

Improperly performed modifications can severely damage your radio.
Use extreme caution. Proceed at your own risk.

Transmitting on frequencies other than those assigned to the amateur
radio service may be illegal.

TOOLS RECOMMENDED
-----------------

1) Small philips-head screwdriver
2) Magnifying glass
3) Small wattage (15 watt) soldering iron with a small tip
4) Long-nosed pliers
5) Paper clip
6) Tweezers

MODIFICATION 1
--------------

Result of modification: The IC-706 transmits only on the ham bands.
This modification allows for transmit on any frequency from 1.6 to
54 MHz. The radio will also continue to transmit on 2 meters (144
to 148 MHz in the United States) at 10 watts output. This modification
will NOT allow for transmit on the AM or FM broadcast bands. The radio
will appear to transmit on most frequencies above 54 MHz, but the power
output will be a milliwatt or less. The highest power output will be
100 watts from 1.6 to 54 MHz (SSB, FM, CW; 40 watts AM) and 10 watts
on 2 meters. (SSB, FM, CW; 4 watts AM) Note: This modification
requires that you reset the CPU. All memory information will be
erased.

1) Disconnect the power cable. Open the TOP cover of the radio.
You will need to remove only 5 screws: three on the top of the
radio and one screw on each side. Pull up the speaker carefully and
set it aside. Look at the radio from the front; the speaker area
```

should be in front.

2) Locate the rectangular, silver 9 MHz SSB filter. This is clearly marked on the top of it. Now look to the right. Note the "D 108" marking. Below this marking, there are three tiny black diodes. There are two diodes, followed by two blank sockets, followed by another diode.

3) The second diode from the left (the middle diode) is diode D-59. This diode needs to be removed. There are many ways to remove this diode. The easiest way is to crush it with long-nosed pliers. Another way is to use a low-wattage soldering iron and tweezers and carefully heat the diode, then pull with the tweezers. Be extremely careful not to apply too much heat.

4) Re-assemble the radio. Press and hold the UP and DOWN buttons on the right side of the front panel, and while holding them down, turn on the power. This resets the CPU.

MODIFICATION 2

Result of modification: The bandpass filters on the IC-706 are improperly wired. As a result, the radio does not receive any stations above 129 MHz, except in the 2-meter band. This modification allows for reception up to about 165 MHz.

(Note: If your radio receives the FM broadcast band (88-108 MHz), the aircraft band (108-136 MHz), 2 meters, and stations above 148 MHz, it is possible that the modification has already been performed by Icom; you may have a later model.)

1) Open the TOP cover of the radio. You will need to remove only 5 screws: three on the back of the radio and one screw on each side. Pull up the speaker carefully and set it aside. Look at the radio from the front; the speaker area should be in front.

2) Locate the rectangular, silver 9 MHz SSB filter. This is clearly marked on the top of it. Now move your eyes toward the back of the radio until you notice a long white connector with several colored wires on it.

3) The 4th wire from the left, a yellow wire, needs to be removed from the connector. You can cut this wire carefully if you wish. Or, another alternaive is to remove it from the connector. Stick a paper clip or perhaps a pin into the side of the connector under the yellow wire. Pull the wire with tweezers and remove it. There are two yellow wires; be sure to remove the 4th wire from the left, not the other one.

4) Open the BOTTOM of the radio, removing similar screws as you did when you removed the TOP.

5) Look at the PC board just behind the MENU button. You will notice a jack marked "J8" with a grey cable coming out of it.

6) To the left of jack J8, you will see five tiny transistors.
Look at the middle transistor. Follow the light green circuit board
trace from the middle transistor to a tiny hole just to the left of J9.

7) The yellow wire from the top of the radio needs to be connected
to this transistor. The easiest way is to solder a small insulated
wire to the yellow wire you just removed, run this new wire underneath
the radio to the hole you found in #6 above, put the wire into the hole, and
solder the wire into the hole with a low-wattage soldering iron.
Use caution not to damage the grey cable or to apply too much heat.
This could damage the PCB and seriously affect the radio.

If you perform only steps 1 through 3, you will be able to hear stations
above 148 MHz, but you will not be able to hear FM broadcast stations
on the 88-108 MHz band.

RECEPTION SUGGESTIONS
---

1) You need to use wide FM to receive FM broadcast signals on the
88-108 MHz band, or TV sound signals between 59 and 87 MHz. To
receive wide FM, press the MODE button until "FM" or "FM-T" appears
on the display, then press and hold the MODE button for two seconds.
"WFM" should now appear on the display, and you should be able to
hear the FM broadcast stations. Reception quality is quite good
if you use a decent external speaker.

2) Aircraft (118-136 MHz) uses AM. You will need to set the radio
to AM to receive aircraft.

3) The sensitivity of the radio diminishes rapidly after about 165 MHz.
NOAA weather stations (162.40 to 162.55) are clearly audible, however.

4) If you find the FM broadcast signals overload the aircraft portion
of the bands, disable the preampifier by pressing PREAMP (the green
light should go out.)

5319. Info on Radius PR3000 pager

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-09 00:00:00 UTC
From: rubenc@iglou2.iglou.com
Message-ID: <DJC0r7.CF6@iglou.com>
Source record: 209247

I have 3 PR3000 UHF pagers that I have had xtaled on my freq, but without the programmer, Im trying to figure out the 2 tones in each. Any way to do that without the programmer? They were originally used with a small Radius desktop paging xmitter, and they have the following marked on the back (was probably the code to punch in on the Xmitter)

Pager 1: 12/88
Pager 2: 14/88
Pager 3: not marked.

Any help would be appreciated so I dont end up having to tx EVERY one of 100 combos to find the tones.

5321. HF rigs without proprietary components.

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-09 00:00:00 UTC
From: yee@mipg.upenn.edu
Message-ID: <YEE.95Dec9103550@picard.mipg.upenn.edu>
Source record: 209249

To me, ham radio is about building, maintaining, using and fixing your own gear. While I also do some homebrewing, I find taking my Yaesu 101B a great deal of fun. Today's rigs are just no fun to take apart. Too many proprietary electrical components and everything is just too small! I can work with discrete components but not surface technology.

Now for my question. What is the most modern rig out there in each of two classes? Alternatively, this question can be answered in the terms of the best performance (RF-wise) in each of the two classes. Ideally, the answers would be easy to play with on the insides.

1) solid state with tube finals? Tube finals are a bit more forgiving that solid state finals. To me, this is a very useful quality as long as I can still purchase finals.
2) all solid state but without ANY proprietary components. I don't want to need to go to a single source to get parts. Generic parts are good in that replacements are easy to get.

5326. Looking for documentation

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-09 00:00:00 UTC
From: roll@Bucklan.Stupi.SE
Message-ID: <4acfm7$2s5@Bucklan.Stupi.SE>
Source record: 209254
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I have got a broken linear amplifier. In it's previous life it where located in the attic, close to the antenna and served it's masters well until the roof broke and rain water dripped into the operating amplifier.

Mixing rain water, 2.5KV, HF and TTL-circuitry turned out to be fatal...

It's manufactured by "Advanced Radio Devices" that used to be in Sterling VA, USA, apparently they are out of business since several years now. The model number is 230C

I have a manual, but for some reason they decided to not include all circuitry that has to do with communications between the actual amplifier and the remote control box (wich has a Z-80 microprocessor).

I'm trying to find the missing documentation of the hardware, and some insight to how the program actually works, so I can diagnose the IO-circuitry. If the SW has any diagnostic/production testing routines that could be handy etc.

If I manage to get this working I assume that all of it including the tuning presets has to recalibrated, but how?

Any information or leed to anyone who might know, would be most appreciated. (as a private email or call)

Hi, I'm listing some gear for Dave/K1DL

- New Ham 4 rotor, $260.

- KLM 2000A 144-148 Mhz allmode transceiver. 10w out
on SSB/FM/NBFM/SSB/CW. Near mint, $200.

- MFJ 768 Super DSP filter. Mint, $100.

- Cubic Astro 103 HF transceiver. 160-10m, solid state,
100W, digital readout, QSK, speech processor, CW filter.
Uses 13.8v supply, not included. Very good condition, $450.

- Other miscellany - it's shack cleaning time.

Call Dave evenings or weekends at (603) 448-3654, he's not on
packet/e-mail.

5332. * Windows Logging/Packet Freeware

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-10 00:00:00 UTC
From: michael_mcamis@valley.net
Message-ID: <4afq1l$a2i@dartvax.dartmouth.edu>
Source record: 209010

Disappointed with your commercial/shareware logging or
packet software for Windows? Try XMLog, freeware that's
available on the Internet. XMLog provides a flexible set
of coordinated logging and packet features.

If you're using a Web browser, start at BARC's home page
(http://www.acs.oakland.edu/barc.html), pick "barc archives",
then "PC stuff" (even though it says MS-DOS only). Select
the "logging" directory and fetch xmlog123.zip

For ftp users, sign on to oak.oakland.edu with the userid
of anonymous and a password of guest. Move to the
pub3/hamradio/pc/logging directory and get xmlog123.zip

The oak archives can be very busy at times, don't give up
if you can't sign on right away. Let me know if you:
- want more info
- can't fetch the file
- want a diskette instead

Have fun...

Mike/WA3ECT

Message-ID: <4afinf$laa@bighorn.accessnv.com>
Source record: 209011

This user group continues to have a somewhat narrow minded approach to current and more recent equipment. Here are some points to po=
nder. Most of the equipment manufactured in the last ten years was and is very well engineered. The problem really being the manufac=
turing processes and technology available at the time. To maintain a competively priced piece of equipment that is multi-featured an=
d high performance takes considerable talent and judgement.
With the advent and implemenation of computer controlled drilling machines that could mass produce PCB's in Glass or Epoxy f=
ollowed by surface mount technology using the same materials has greatly increased the reliability of todays amateur radio equipmen=
t, while controlling cost. I don't know of a single manufacturer that isn't glad to see the demise of phenolic double-sided PCB cont=
ruction. All have had their fair share of problems. Only a few of todays products have phenolic boards. They will continue to cause =
problems because of their thermal characteristics of expansion and chemical property changes with time and temperature. However, th=
ey will all be gone....soon.
I might also point out that our own environmental laws have made it so difficult and costly that made in USA products virtua=
lly are non existant. Only their names remain, while off shore manufacturing in many cases trash their environments. A true parody e=
xists.It is driven by only one factor...cost.
Having worked in the Amateur Radio industry for 20 years selling and servicing equipment only one thing is certain. We call =
it change. The playing field of manufacturing processes is now nearly equal. The only difference that one of the big three uses a li=
ttle more in house, not so techie stuff. This probably to hide more of their designs from outside eyes in a very competetive market.=

In the new equipment commentary and critique, it seems that the only interest is dc-light coverage. With this comes median p=
erformance. The current "in vogue" radio has not been criticized for it's sloppy CPU mask and features stated that just plain don't =
work. The radio which was suposed to be in "beta" test for 6 months "passed with flying colors", by those who used it and either ign=
ored the problems or were ignored at the other end in production. We end up with flawed sophisticated radios in a not so sophisticat=
ed and appreciating market.
It is unfortunate that dealers under very competitive pressure have to take the brunt of it all. Yes consumers there are maj=
or costs involved. Large high volume dealers with 1-800 numbers spend a very significant amount of money, fending off questions rela=
ting to either illegal radio modifications or those that quite possibly should have been

there in the first place. The bottom line i=
s many thousands of todays hams are pounding away in equipment insides which they have no skills or talents causing service nightmar=
es. The result is that many of them are being returned nation wide with damage done by end user, yet claiming defect out the box!
Clearly I have seen several products hammered in this forum that were technically sound and or superior in nature. These wer=
e passed off with comments such as, "I took mine back and got a so and so." Or, in one case someone said "make them eat it!" In case=
s of clear recent memory without going into the "whom and what", because of obvious liabilities from society. All of the informatio=
n needed was immediately at hand if the pages of the manual were viewed.
Todays wizard and computer guru Mr. Bill Gates is mostly credited with the implementation of "Plug and Play." This concept h=
as been around in radio for well over thiry years. Let's say that "Johnson Messanger One" was the first full implementation. It was =
a real work horse and had 5 channels and five Watts!

ed and appreciating market.
It is unfortunate that dealers under very competitive pressure have to take the brunt of it all. Yes consumers there are maj=
or costs involved. Large high volume dealers with 1-800 numbers spend a very significant amount of money, fending off questions rela=
ting to either illegal radio modifications or those that quite possibly should have been

there in the first place. The bottom line i=
s many thousands of todays hams are pounding away in equipment insides which they have no skills or talents causing service nightmar=
es. The result is that many of them are being returned nation wide with damage done by end user, yet claiming defect out the box!
Clearly I have seen several products hammered in this forum that were technically sound and or superior in nature. These wer=
e passed off with comments such as, "I took mine back and got a so and so." Or, in one case someone said "make them eat it!" In case=
s of clear recent memory without going into the "whom and what", because of obvious liabilities from society. All of the informatio=
n needed was immediately at hand if the pages of the manual were viewed.
Todays wizard and computer guru Mr. Bill Gates is mostly credited with the implementation of "Plug and Play." This concept h=
as been around in radio for well over thiry years. Let's say that "Johnson Messanger One" was the first full implementation. It was =
a real work horse and had 5 channels and five Watts!

Larry,
I'm interested in your 530. I presently have one, and I'm looking for one for my wife.

What I would like to know is, what the serial # of the unit is. It can be found under

belt clip on the back. It's a little hard to see unless you hold it just right in the light.

You can contact me back at my Compuserve address: 102331,3704

I look forward to your response,

Thanks, Dale Jones

5340. Re: Pls Help W/ TenTec 570 Info

The Ten-Tec Century 21 Model 574 was my first rig! I bought it new from a radio dealer in Medford, MA in 1980. It was perfect for a novice station. At the time I could only work CW on the HF bands and did quite a bit of that. This rig served me well over the years.

I'd say that its a fair price and a very inexpensive way to enter the hobby considering the cost of new equipment. For novices, this may be the best way to get onto HF and improve your code speed.

An external DSP may solve your QRM problems. The filtering was not all that spectacular. I recently purchased a Radio Shack DSP unit for $50.00 that I'm currently using with my Ten-Tec Scout. It does a pretty good job of eliminating QRM and I cannot complain about the price.

5341. Icom 706 TX Mod for 135 to 175 mHz, cont.

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-10 00:00:00 UTC
From: leigh@rain.org
Message-ID: <4adrca$nl1@news.rain.org>
Source record: 209074

Here is another Icom 706 TX mod bulletin, posted on Packet
by NS1R. This one claims to have more info on the expanded
VHF TX mod, with a claimed transmit range from 135 to 175 mHz.

It is reprinted below, numerous typos included.

(Could this be another hoax, as was the Radio Shack HT "April
Fool's Day" TX mod? If anyone screws up their rig with this mod,
I ain't responsible..)

FWIW... --Leigh/KM6JE.

From: NS1R@KA1TUZ.FN42JH.MA.USA.NOAM
To : INFO@USA

Hi, I have been posting tx mod info on the ICOM 706 and have heard back
from two people who work at ICOM USA. They are unaware of TECHNICAL
BULLITAIN #711-1_ They UNOFFICIALLY said that removing DIODE #59
restores transmit 1.8 to 54 MHZ and also you can open up the VHF
SENSITIVITY on 2 meters from 140 to 174 by simply cutting "J4" on the
"PA DECK". That is all they will confirm (UNOFFICIALLY". They said
they have no knowledge of this technical bullitain 711-1_ .

It appears to be an official Tech BUlitain to me. I have a photocopy.

The additional items to in the Tech bullitain to restore out of two
meter transmit are as follows (not endorsed or denied by icom USA):
remove Diode #60 and cut the jumper next to it labled "W4". Then
remove either (Q38 or R353 resitor) on the main PCB (about one inch to
right of Diode #60. Then turn over the radio and cut a trace (You need
picture of schematic to see clearly and install a jumper froM IC32 pin
11 to the point where you cut the trace. This will restore transmit
from 135 to 175 MHZ.

I have not done the final modes as I said earlier by opening up the VHF
side of the rig for receive You open it up for INTERMODE also!!! That
is all for today NS1R STEVE

Source record: 209075

Charlie,

Sounds like the PR3000's (also known at the Motorola Keynote) was a part of the paging system Motorola had called the RPB50. the keyboard was sold with PR3000 pagers.

The 12/88, 14/88 is most likely the two digit pager code 12, & 14. The RPB 50 system was designed to accept two-digit entries. You could also have group call (why the 88 was the common group call).

If you need more info, email me & I can look into this unit for you from the Service Manual/ programming information.

I've owned a Scout since December of 1993 and have been very satisfied with it! I sent it back to the factory for warranty service once and the rig was back within a week, fixed right and working fine ever since. I've been a Ten-Tec customer since first becoming licensed back in 1980 and have had excellent experiences with their service department each time.

The Scout is a great rig that doesn't cost too much. It doesn't have all of those extras that seem to jack the price way up, and for the most part I have not missed all of the bells and whistles.

My only experience with SGC concerns a tuner I have. I had
acquired the SGC-230 tuner and the special antenna that is
used with it. I contacted them to try and purchase the tin
box to complete the QMS system. What I wanted was just the
tin box which has a few rf connections and a place for the
antenna mount. For this they wanted $500!!! I thought this
was an error so I faxed the CEO directly. The reply was not
from him but from some flack who continued to insist the tin
box was a highly sophisticated piece of equipment that was
worth $500. That was the end of my trying to work with SGC
I made my own tin box from a rocket box, heck if it's going
to be ugly anyway. Bottom line it you do it their way. This
is probably why they do not have many dealers. The amplifier
looks interesting but considering their inflated performance
claims and lousy attitude I won't be buying one. Did you hear
that Pierre?

Thanks for the great test results! As for the cables, I, too, agree that they are priced far too high. The head separation cable is $50! As for the power cable, I am using the same power cable that I used for my TS-50 (before I sold it), and I think the Yaesu's use the same cable (FT-736, FT-790, etc.). Maybe it's cheaper somewhere else... of course, some enterprising person has likely already got cheaper cables out there, ready to run!

No, not exactly. A regulated supply will hold the same voltage with
varying load current and input voltage (both within specified ratings).
You can have a ripple free supply that is not regulated. You may be
confusing filtering with regulating. A poorly filtered, or unfiltered
supply will have ripple and other trash on its output. For that matter,
you can have ripple on a regulated supply. Generally, though, today's
regulated supplies are very clean.

Source record: 209093

I don't know if we are talking the same radios here but I have the ALINCO DJ-560 HT (2m/440) and I have the usual owners manual. I presume you are talking of the same Radio (?), and I don't have the SERVICE manual. I must comment that I did order a service manual for my DJ-160 from ALINCO for $10, I also purchased the TX RF amplifier hybrid module from them at a cost slightly higher then most RF parts distributors (I think I paid $49 for it), but I ordered some other parts at the same time. I think you can't find a better deal in service documentation (tho skimpy as it is). (Radio Shack has very good LOW-COST and well written service manuals, at least for the equipment I've owned).

The folks at ALINCO tech support were helpful and knowlegable (I wasn't placed on hold to listen to MUZAK). But at one time when trying to locate a small part (a belt-clip), I was told that this was not a 'SERVICE' part and was given a list of dealers to contact as this was a 'DEALER part. All the ones I called did not have it as the radio was discontinued. Even if ALINCO had the part they could not sell it to me as the transaction would 'cross' the line, I guess. Hey, to me...PARTS IS PARTS! Customers should not be given a run-around, especially on a trivial part as this (what, $5 at MOST!).

Bottom line: I like ALINCO products, tech support low-cost docs, relatively low parts costs BUT they get a BIG BLACK MARK next to their name when they don't provide support on cosmetic items (so-called DEALER PARTS) on discontinued models.

So anybody got a used BELT CLIP for a DJ160? I'm still looking.....bye....

Source record: 209097

I've been messing with the 706 band scope. Using a magnifying glass, it appears that there are 14 dots on each side of the center gap. If the 2kc range is selected, each dot represents 2kc thus giving us a 28kc X 2 sweep range. If the 20kc range is selected then we can sweep a total of 1120kc. This allows sweeping of the wider bands such as 10 and 6 meters.

There's a few things that bug me and maybe someone has a suggestion or comment.

1. Each pass of the sweep erases the previous marker that was originally put there by a signal. This means that you must stare at the scope and be ready to hit the f-3 button before it sweeps past that point again. Wouldn't it be nice if it would accumulate the marks?

2. The audio is muted while scanning which makes me have to stare at the scope. If it wasnt muted, I could hear signals go by as it swept which would alert me to hit the f-3 button. Any ideas how to unmute the audio?

3. Is there a way to speed up the sweep thus increasing the odds of catching cw signals?

4. With the rig connected to a pc with the proper interface, can one observe the scope feature?

5. Has anyone managed to interface their 706 to a pc? What software did you use?

5367. Results:survey of factory repair times

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-10 00:00:00 UTC
From: "John T. Young" <jtyoung@u.washington.edu>
Message-ID: <Pine.PTX.3.91j.951209133418.9644A-100000-100000-100000-100000@carson.u.washington.edu>
Source record: 209100

Thanks to all who wrote in with their comments on this very informal and non-scientific survey of repair time for major brand radios. I received 13 responses and I will summarize each response:
1). Alinco "in on Monday, got it back Friday of same week..across the country"
2). Alinco "in on Thurs., back the next week on Friday; shipped next day air at Alinco's expense"
3).Alinco "I broke the radio. Alinco repaired it, had it back to me a few days later, they shipped it 2nd day air, all free of charge!"
(all three aforementioned hams were very happy customers)

4). TenTec "two weeks"

5).Yaesu "three weeks" incl. shipping VA to CA"
6).Yaesu "about a week. damage my fault. repaired free of charge. excellent service"
7).Yaesu "eight weeks. fixed original problems but came back with new problem. new prob. took adtl. one week. Service manager very good.Service clerks mediocre"
8). Yaesu "three weeks total, from Michigan. No complaints"

9). Icom "IC745 sent to Icom twice for xmit problem. Not fixed and returned with two more new problems. Now will use local guy for repairs"
10). Icom "have used ICOM gear for long time, always good luck when in need of advice or parts"
11). Icom "rig at service factory right now. Icom postcard says est. turnaround time 45 days"

12). Standard "on phone, technician is intelligent about what needs to be done, price, scheduling, etc."

13). AEA "TNC went in on Monday. Had it back on Thursday"

For some unknown reason, I received not a single response regarding Kenwood repair service. Anybody ever have a problem with Kenwoods??? One ham wrote in saying that Kenwood's repair service was actually a privately contracted company and that Kenwood had sold its Parts and Service Divisions. This ham did not, however, relay his own repair experiences with Kenwood or any other company.

Thanks again to all who responded and I hope this helps. If I get more responses, I'll post them too. 73 de John, KI7JB.

From: Frank Paxton III <paxton@sound.net>
Message-ID: <4afd8u$cgu@guitar.sound.net>
Source record: 209104

i have a ge master exec II conversion that i did.
i had to turn the power down to about 15 watts, and 'shield' the receiver
to get rid of the 'crosstalk'.

first thing is to turn the power WAY down...say to 5 watts. see if that works.
if it does, add power until you find out where it DOESN't work.

if you can live with the power setting, you're there.

if not, you'll have to 'shield' internally. that means basically to take
double sided board and build 'dams' around leaky rf areas ... this was
necessary
for me when i put a HOT PREamp in the thing...

good luck.

de ng0n. frank.

I assume that the building you are speaking of is multiple
occupancy (apartments, condos etc.) and that the televisions are
commercial cable-connected. If this is the case check out your
television(s) and make sure that all the cable connections are tight.
If this doesn't help call the cable people, it could be poor shielding
in the coax. Saving a couple of pennies on each cable hook-up can save
the cable company a lot of money over all.
As far as repair versus buying new, make certain that the RF
is emanating from the monitor and not another part of the hardware
(keyboard cables are notorious for being poorly shielded). Put RF
chokes on all computer cables and AC lines, check that the case is
securely anchored to the chassis, etc. before spending any big bucks.
If you decide the monitor is the problem, I would suggest a
getting a new one unless the one you have is a top-of-the-line model.
You've gotten your money's worth out of the old one and can always
keep it for a spare or sell it.
I experience noticibleTVI (minor cross-hatching) on channel
two on a television about 8 feet away from the computer desk but the
television in the next room is unaffected. These televisions are not
cable-connected.
hope this gives you some insight

Source record: 208958

Hello,

I've got an old Kenwood that I want to purchase a couple of sets of replace finals for. I don't know anything about tube replacements. A gentleman
told me about a place selling ruggedized 6146W tubes for about $18 a piece.
My Kenwood has 6146B tubes in it for finals. Are the 6146W tubes a good
replacement for the 6146B tubes?

Are they "electrically" equivalent?

I figure if I'm going to get some spares, I might as well get the
toughest/best availible, and I assume the ruggedized W's at that price
new would be the best way to go.

Thanks,
Dave

Jay,

The '99er has a built in A.C. power supply. You simply need the right power cord for it. Some pins need to be jumpered in the connector that goes to the radio. I'm not sure whether or not the 12V DC supply is built in or an add-on but if you see a vibrator inside, then it's in there! Hopefully someone who has one of these wonderful W.A.N. (worked all neighbors) radios can help with the wiring. :)

Well this afternoon I discovered that the bottom cap is glued on and by doing a little prying with a small screwdriver I was able to pop it off. I tried it on a second battery and that bottom appears to be glued on better so I have not been able to get it off yet. I would rather not beat the case up.

5386. Yaesu FT-8500 Auto Receiver Mute Function ???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-11 00:00:00 UTC
From: linvillm@gordon-nsc1.army.mil
Message-ID: <cb7cb$15322f.95@news.csra.net>
Source record: 208969

I have some heartburn with the Auto Receiver Mute function
on my Yaesu FT-8500 / MH-39 dual band mobile rig.

The programming options for automatically muting one of the
bands in case of activity on both bands at the same time seems to
be illogical.

The only auto muting options seem to be:

1) Off
2) Always Mute the UHF
3) Always Mute the VHF

Seems to me the logical thing to do (and what they did do in the
FT-51R) is to have a choice to mute the SUB band (the band which
is NOT currently selected for operation) and let the audio pass
on the MAIN band when there is activity on both bands at the same time.

The only other muting option is to mute BOTH bands (why would I
do that) from the dtmf pad on the mike.

Have I missed something in the manual or did Yaesu miss something
in the programming on this one ??

Well...
I have one Kenmore radio. Once it was in the shop for like 3 months, waiting for parts. Never again.

I have 4 Yaesu products. I broke one myself and it took Yaesu a little over a week to fix it, no charge.

Oh and I also now have an old Icom 220 mobile. Works fine, but the ergonomics are bizzare!

YMMV...

Hi Jack,
The Heathkit amplifiers DO that! (At least mine does!)
I have added a 220 Variac which I adjust to get the plate voltage
where I want it. I just ordered new capacitors (14 weeks!) so
I'll let you know if it makes a difference.

By the way...

The replacement capacitors are 1/3 the size of the existing caps,
has there been a breakthru on capacitor technology?

Tom

Message-ID: <4ag60v$62k@news.iii.net>
Source record: 209021

Hi Jack,
The Heathkit amplifiers DO that! (At least mine does!)
I have added a 220 Variac which I adjust to get the plate voltage
where I want it. I just ordered new capacitors (14 weeks!) so
I'll let you know if it makes a difference.

By the way...

The replacement capacitors are 1/3 the size of the existing caps,
has there been a breakthru on capacitor technology?

Tom

5397. FT-1000 lock main and sub vfos

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-11 00:00:00 UTC
From: rlong@magnus.acs.ohio-state.eduu
Message-ID: <rlong-1012952309510001@slip1-54.acs.ohio-state.edu>
Source record: 209023

FT-1000:Tracking main and sub vfos

I have a memo written by w8egb which would allow the sub vfo to track the main vfo when the main dial is turned. This is convenient when using the stereo reception mode. He also suggests that if you work 10 meter fm repeaters it would allow you to set the offset and then tune to different repeaters by only changing the main dial.

The problem is that he says that at the time he wrote the memo (1992) he had not tried his idea - and I am unable to reach him by telephone. His idea briefly is to cut the wires to the sub dial encoder and insert a dpdt relay. In the off position of the relay the wires are restored to the sub encoder. In the on position of the relay the wires that formerly went to the sub encoder are connected to the main encoder, in parallel with the existing wires to the main encoder. The relay is controlled by an unused front panel switch, say the DIM switch.

Has anyone tried this, or any other idea which accomplishes the desired goal.

Thanks. Ron w8gus.

5398. Do I Need a DSP?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-11 00:00:00 UTC
From: sherwood@oribi.cig.mot.com
Message-ID: <sherwood.818647256@oribi>
Source record: 209024

Hi folks.
I just discovered a new operating mode (for me). Keyboard CW using my
KAM+ TNC. The only problem is I have to use my 1.8KC IF filter.
If I use my 500Hz IF filter, the noise generated by it creates lots of garbage
output from the TNC. The 1.8 filter really lacks when there is a strong
station close by and the AGC kicks in. Station is a ten tec paragon
and kam+ TNC.

1) Will a DSP remove or help remove the noise from the narrow filters.

2) And now the six million dollar questions (Hope I dont start a war).
Whats a good DSP and what should be avoided (RS I know).

Thanks a lot.

Hi Tom,

You really need to work on that stutter, or was it on my end? ;-)

There are better foils now, so caps can be smaller. Be VERY careful to
watch the ripple current rating. Some of the small case sizes will not
dissipate heat caused by the ripple charging and discharging the cap
through the internal resistance of the cap. They may have shortened life.

One tip on operation with the 720A is to never try to receive in crowded band conditions.

You may want to invest in an audio DSP unit.

From: leigh@rain.org (Leigh)
Subject: Icom 706 TX Mod for 135 to 175 mHz, cont.

Here is another Icom 706 TX mod bulletin, posted on Packet
by NS1R. This one claims to have more info on the expanded
VHF TX mod, with a claimed transmit range from 135 to 175 mHz.

It is reprinted below, numerous typos included.

(Could this be another hoax, as was the Radio Shack HT "April
Fool's Day" TX mod? If anyone screws up their rig with this mod,
I ain't responsible..)

FWIW... --Leigh/KM6JE.

From: NS1R@KA1TUZ.FN42JH.MA.USA.NOAM
To : INFO@USA

Hi, I have been posting tx mod info on the ICOM 706 and have heard back
from two people who work at ICOM USA. They are unaware of TECHNICAL
BULLITAIN #711-1_ They UNOFFICIALLY said that removing DIODE #59
restores transmit 1.8 to 54 MHZ and also you can open up the VHF
SENSITIVITY on 2 meters from 140 to 174 by simply cutting "J4" on the
"PA DECK". That is all they will confirm (UNOFFICIALLY". They said

they have no knowledge of this technical bullitain 711-1_ .

It appears to be an official Tech BUlitain to me. I have a photocopy.

The additional items to in the Tech bullitain to restore out of two meter transmit are as follows (not endorsed or denied by icom USA): remove Diode #60 and cut the jumper next to it labled "W4". Then remove either (Q38 or R353 resitor) on the main PCB (about one inch to right of Diode #60. Then turn over the radio and cut a trace (You need picture of schematic to see clearly and install a jumper froM IC32 pin 11 to the point where you cut the trace. This will restore transmit from 135 to 175 MHZ.

I have not done the final modes as I said earlier by opening up the VHF side of the rig for receive You open it up for INTERMODE also!!! That is all for today NS1R STEVE

I have a Kenwood 621A 2 meter/220 mobile dual band radio. Radio is in very good condition with some scratches to sides.
Operates flawless. Want to sell to get 2 meter/440 mobile. Asking $425.00 might consider trade to dual band 440.
If interested contact: marsmith@harold.eastky.com

5421. More on IC-706

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-11 00:00:00 UTC
From: rcarpen@DGS.dgsys.COM
Message-ID: <Pine.SOL.3.91.951211171439.23879A-100000@DGS>
Source record: 209047

I've read the past 2+ months of archives on the IC-706. Surely one of the main problems is overly optimistic advertising. I haven't mod'ed mine, but offer the following analyses, mostly concerning reception on the FM BC band (the nearest FM BC station is about 9 miles distant):

> The WBFM IF bandwidth is something like 500 kHz with broad skirts, far far too wide to be useable in any major metropolitan area. The Baltimore / Washington area has many stations spaced 400 or even 200 kHz apart. There is no hope for the 706 to separate them.

> It is very common for FM stations to be spaced 10.4, 10.6, 10.8 or 11.0 MHz apart. The 10.7 MHz WBFM IF is so wide, and even moderately strong stations drive the rig into intermod, that this problem severely limits FM BC reception. OK, 10.6 and 10.8 MHz spacings must be quite a few miles apart.

> The WBFM first IF is at 70.7 MHz. The color subcarrier of my local TV channel 4 is at 70.8+ MHz, which is well within the WBFM IF.

> I have two pairs of FM BC stations, one of each pair about 10 miles away, the other 30 miles distant, where the spacing is exactly 9.0 MHz, the second IF frequency on all but WBFM.

I've added a high-pass 88 MHz filter with nulls at 70.8 and CH 4 and 5 video carriers; also a trap tuned to one strong local FM station. Now I can use the preamp above 120 MHz on the aircraft band and actually hear a weather station. The FM BC performance is still very unsatisfactory. Lots of intermod on FM BC, even with the attenuator switched in. I get the impression that the LO inject level may be inadequate.

Other than the above, resulting from the ads not matching reality, the 706 is a nice little rig.

Wow- give the guy a chance. I talked to Mr. Goral for some time at
Dayton this year and found him to be quite interesting. Probably
quite a good businessman, too. Most of his business would appear to
come from the maritime industry and South American govt./military
orders. You can't very well expect him to sell the parts for less
than the price of the complete equipment, can you? His pricing
strategy seems pretty smart to me. The basic equipment, which is
all that most hams will purchase, is very affordable for
commercial/type accepted radios. Yes, you can buy an Astron power
supply instead of SGC's and save big bucks. However, the commercial
purchasers want a package deal with good support and- viola- SGC
maintains a reasonable profit margin. It seems to me that he is
just giving us another choice (which a lot of people have taken).
I'm sure if you phoned RF Harris they would be more than happy to
sell you their auto-tuner for about $2000, after a sufficient
run-around and then demanding a wire transfer of funds.

Lest we forget....the practical history of these rigs....

It seems the first runs of many rigs go through a shake down period.
I have heard, but never experienced this, with the Kenwood 440
and 940 series, where Kenwood was breaking relatively new ground.

I have owned a 440 and 940, neither of which has had the slightest
design problems show up. I love my 440 dearly, as do many others I
know. In fact, my 440 with IRCI filters throughout, and a few other
simple mods still impresses me more than a whole lot of newer radios
out there. It has chugged along trouble free for the three years
I have owned it.

I have several friends with 850's, and I really respect that radio,
when you are buying Japanese. I have recently had a patriotic rebirth
and am buying American now, so I have the Ten Tec OMNI VI which I
am very pleased with.

Ken,

Perhaps you didn't understand. He sells the whole thing for $800.
The tuner is $500 the antenna is $300 the mount is some other amount.
I have the $500 part I have the $300 part plus a bit more. I want the
lousy tin box that is not worth $500 perhaps $100 but not $500.
Does the Ford dealer charge $12000 for a fender? As to giving SGC
a chance I called a my expense 4 times. I faxed at my expense twice.
I really thought there was a breakdown in communications and they
thought I wanted a tuner and box. There was no lack of communications.
They simply rip you off if you don't buy the package. I will not do
business with them and I recommend other do not either.

Many owners

Have you ever heard a 1 db increase in signal? Even a 2 db increase? I
am honestly curious. I dispute your point that 110-150 watts can make a
difference over 100 watts in any practical sense. I have tried that
but absolutely never found that the other station could tell the difference.
I do not distinguish between two transmitters unless the power is doubled,
and even then, it is a very small difference as far as I can tell.

> "This modification substantially improves the FM VHF out-of-band
>receive performance. However, you may notice some diminished sensitivity
>on VHF WFM broadcasts.

This mod wrecked my ability to receive aircraft and the FM BCB.

You alsoneed to run a wire from your cut yellow wire to the PCB hole just
to the left of jack J8 on the back of the rig. On the bottom PCB, you will
see five tiny transistors located just behind the MENU button. Look
at the middle transistor. Follow the trace from the transistor to the
hole next to J8. You need to solder a wire to this hole, and run the wire over
to the other side of the rig, and attach it to the yellow wire you cut.
Then the rig will receive well on most of the VHF range (from 60 MHz
up to about 162 MHz.)

Be very careful doing this. Use a low-wattage soldering iron and be
careful not to damage any other wires or PCBs. I have tried this, and
it works, but proceed at your own risk. An improper mod can damage the
radio.

Yes, it's possible. The KPC-3 includes a diagram for wiring
the cable, or you can buy pre-wired cables. I understand that the
range is very limited, though. An external antenna should help.

I too have a 720A and it had been very good. I checked with Icom about returning it for alignment and was advised I would probably spend between $100 and $200. I decided to use it as is, and don't regret it. Also, there are a couple of parts that are no longer available, so you don't want to invest too much in it. I believe that bandswitch relay and the microprocessor are on the endangered species list.

Hello,

I would like to bye a new dual band HT. I heard about new model from Alinco
DJ-G5.
I would like to know some informations about this handheld.
For Example:

speed of scanning in memories (DJ-G5/TH-79 => DJ-G5 faster ??? etc.)
Is possible extending for 300/800MHz (Europe version) ???
Possibilities in frq extending (108-174....) ???
Can DJ-G5 scan tones. Is in standart equipment CTCSS module ??? or only
CTCSS encoder ??? and CTCSS decoder is optional ?

Yes, I know, I have many questions about this new dualband, but I would
like to buy something better than my old TH-79E.....

Thanx a lot, c u l8r

Maybe these postings should be collected in a computer noise FAQ?

In article <01HYHMLQECG200DMXW@uthscsa.edu>,
MUENZLERK@uthscsa.EDU (Muenzler, Kevin) wrote:
[
[My only suggestion is to put the antenna(s) as far from your
[computer/shack as possible. That is the only way I was able
[to cure my computer noise problem. Also, make sure that your
[rig is grounded well. Be sure that your cables (video, printer...)
[are of the shielded variety.

Unfortunately long feedlines cost power and received signal strength,
esp. at UHF.....

First, try and isolate the noisy box. I found the most noise in my
situation was coming from the monitor, second most from the keyboard.
I discovered this by turning the monitor off with the system running,
and simultaneously listening to the RX. Also, unplugging the monitor
video connector from the computer while it was running is a good test.

My monitor was quiet when it was on, and the computer off - don't laugh,
todays microprocessor controlled monitors (like the NEC 4FG) can make
RF noise by themselves.

I made a noise sniffer by taking a piece of RG58, stripping back the
shield 3" and putting a piece of heat-shrink over the exposed area.
I used this for an antenna, and used the RF gain control to help me
zero in on the noisy areas in the equipment.

My printer didn't add any noise by itself- I was lucky. A friend
discovered his printer threw birdies all across 20m and 15m. By
accident he discovered that an identical printer was quiet (his
brother broke a tractor, and they swapped printers while he fixed
it - the swap became permanent after the discovery. It helped
that brother wasn't a ham). Unplug cards individually - you may find
that your sound card is the bulk of your noise, or maybe one brand
of video card. One off-brand no-name 3.5" floppy drive trashed 2m SSB
for one friend - changing to a different band solved that problem.
Strip your sysem down to a motherboard and power supply then turn it
off and on. Check for noise. Add the video card. Check for noise.
Add the monitor, with the monitor power off, check for noise. Turn
the monitor on, check for noise with the computer off and on.
Add the disk controller card. Check for noise. Add the floppy drive,
sheck for noise. Add the hard disk. Check for noise. Add the keyboard,
checlk for noise... get the idea?

I took the back cover off the monitor and poked around to find the noise generator. To make a long story short, I found that 90% of the noise was coming from wire that fed the video signal from the circuit board to the control grid of the picture tube. I replaced it with a piece of RG-174 coax, with the shield grounded on both ends. Spraying the inside of the monitor case with conductive paint ("Aquadag" is one name for it) helps, as long as you can figure out a way to make sure it gets grounded when you put the cover on. Putting copper screen over the vent grilles may help - I got some at the local model railroad shop - I have no idea what they use it for...
The rest of the monitor noise was cured by stripping some braid off some old RG-8 and fitting it over the video cable from the monitor to the computer. It took two layers, as the shield isn't 100%. Ground both ends. My other monitor has a shielded cable already- so check yours, this step may be a waste of time. On the other hand, the other monitor had a non-metallic shell on the plug, and the briad wasn't grounded on the computer end. Changing the shell out was needed on that monitor.

The keyboard noise was more troublesome, as the sniffer revealed that much of it was coming from the hole in the case top that the keys fit through. Using a scope I discovered that the scan signals were very sharp square waves. A few very small capacitors from the junk box (in the 10-20pf region) across the address and data lines of the microprocessor in the keyboard knocked down most of it. I normally don't recommend trying this, as the processor can be easily screwed up by capacitance, but I paid $28 for the keyboard new, and figured that if I destroyed it I'd only be out $28 for a new one. On this keyboard adding braid over the cable didn't help - and it made no difference if one end or both were grounded (I cut away a 1/4"x1/4" of the molded rubber and soldered the shield to the plug shell to ground that end). Rounding off the square wave edges with the capacitors did more good.

Covering up the empty slots on the back of the case helped a LOT. Adding braid over the printer cable helped get rid of noise that shows up while printing- ground on both ends. Note that some DB connector shells are non-metallic plastic, others are plated plastic, others are real metal. Buy the real metal ones if buying new cables. Inmac has excellent shielded cables - but they are pricey.

Beware of external tape drives, hard disks, CD-ROMS, etc. Many of them have high speed data cables connecting them to the computer. If you are going to buy these, buy internal versions of them. Even if you end up buying a new mini-tower or full tower case and rebuilding your computer from a desktop case. If you are building a new computer for the shack, get a case with twice as many drive holes as you think you will need. I've had the same tower case on 4 different motherbaords and 6 different drive configurations since 1990 (hint: cases don't wear out - buy a good one). Sometimes some creative purchasing can sidestep that problem: a friend had two 5.25" hard drives and wanted to add a CD and a tape backup - and was going to have

to get external versions of them. He ended up purchasing a 3.5" hard drive to free up two 5.25" drive bays, and mounting the new drive "creatively" on a home-made bracket made by bending up a metal shingle. Newer cases have blind drive bays for hard drives, his didn't.

Sometimes it isn't the computer that makes the noise. One problem system was making noise when the user was running traffic on 20m cw (full break-in), but was quiet during receive. Testing it on my bench revealed it wasn't the computer. Taking my coax sniffer over to the victim's house revealed it was the bells-and-whistles digital telephone (the kind with autodial memories, etc.) that had problems with RF. Adding a few toroids to the handset cord jack and to the phone line jack made the phone happy. Or we could have swapped it for an old AT&T / Western Electric phone. Note that the phone was working fine, and exhibited no squirrely tell-tales while it was radiating...

Sorry about the length of this posting... just thought I could help.

**********Radio**********

Not directly with the "PowerTalk" front end, however, I purchased the SG-2000 with their tuner for under $1500 new from JSI and it was drop shipped from SGC.

Being that I am both a Ham and a Sailor who wants to use the Marine frequencies the fact that the SGC is type accepted for the Marine service was a very important consideration.

At any rate, thoughts about the radio. Prior to purchasing the radio I was rather concerned about the 100hz frequency step size. There is no way to slew the radio in between the 100hz steps. For voice use (which is what I have been doing thus far) it has really not been a problem at all.

The display is very nice and easy to read, the front panel is more intuitive than I originally expected. The layout of the numbers is

1 2 3 4 5
6 7 8 9 0

which I thought might bother me but it turns out not to be a problem. The biggest problem I have with the front panel is that when you hit the frequency change and start moving with the up/down arrows, if you stop for more than about 10 seconds the control parameter reverts back to volume control. This can be truely annoying when looking for signals in the ham bands but is fine for wandering around the Marine SSB bands.

Keep in mind that this is with the older style front panel. I am considering upgrading to the new PowerTalk front panel, mainly for the knob!

I have been inside the unit for some minor modifications (they have installed a filter to get rid of the AM broadcast band to prevent interference which they provide a simple mod to remove) and the rig is very nicely built. While it is all surface mount it is layed out very cleanly and with lots of space. Repair of this unit should not be that difficult. They do provide schematics in the manual as well as detailed tuneup

instructions.

One interesting feature is that the Rig can handle up to 9 (if I remember correctly) control heads. Any number of these can be computers as the link between the control head and the main radio is via an RS422 link, 3 (or was it 4) dc control lines, and two audio lines.

The memory system works nicely and has 650+ preprogrammed frequencies and then you can add 100 more of your own which include information about USB/LSB, mode, etc. My only complaint is not storing the status of the attenuator and noise blanker. I find that listening to the BBC on 7320 tends to need the attenuator in the loop to get the signal strength down.

I have found that another local transmitter which is within 3khz causes some reciever noise and that a local reciever (i.e. 200 ft away) tends to hear a bit of 'motor boating' when there is no audio comming into the mike, i.e. mike down but no audio input but if there is any audio signal at all it goes away. This may be an interaction of the compression algorithms. I have never heard anyone note it except the one ham which lives within 200 ft of me. It seems to be many db down.

The rig seems to be rather immune to noise on the DC circuit (I live on a 35' sailboat and the rig gets power right off the main buss panel), inverter noise, fluorecent lights, etc don't seem to cause any trouble.

**********Tuner**********

The SG-230 tuner is a complete success!!! It is the most wonderful piece of e a person could ask for. Currently it is managing to tune the entire rig of the sailboat as a loop antenna. I simply disconnected the ground to the backstay and connected the ground to one terminal of the SG-230 and the RF terminal to a wire off the backstay down below decks. I have talked to other boats as far away as the Azores and Columbia without difficulty.

The nice part about this tuner is that it has a frequency counter which samples the input signal, if the signal is one which it has seen before then it switches in the correct signal, checks the swr and if all is fine returns the 'tuned' signal. If it is not, then it goes through an algorithm which takes about 2 seconds worst case to find the correct match. Very impressive. If it is a frequency which it has seen before it takes about 20ms for the match to occur.

If you have any additional questions about either of these pieces of hardware, please let me know. If anyone has direct experience with the 'PowerTalk' option I would love to hear from them.

I've dealt with OCC on 3 occaisions, beginning about Sept. 1994. I have no complaints with them. I can't speak about return policies or anything, since I've had no need to return, but I'd encourage you to buy from there.

5445. NS1R's Dubious Icom 706 VHF TX Mod

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-12 00:00:00 UTC
From: leigh@rain.org
Message-ID: <4aj1e2$rva@news.rain.org>
Source record: 208921

Well, it look's like NS1R's claim of seeing an Icom bulletin
mod sheet with extended VHF TX for the Icom 706, is dubious.
Tonight on Packet he put out the following message stating:
"I DO NOT HAVE the extended VHF TX MODE" (sic) for the Icom
706. This totally contradicts his messages of a few days
earlier.

Something is very flaky here... sorry to have
reposted his misinformation on Internet. --Leigh/KM6JE.

From: NS1R@KA1TUZ.FN42JH.MA.USA.NOAM
To : QUERY@USA

Hi, I got the Icom 706 TX mode for 1.8 to 54 MHZ. Simply remove diode #59.

I also have the mode for vhf restored sensitivity (135 to 175 mhz).
Simply cut Jumper #4 (yellow wire) on the bottom of the radio on the
"POWER OUTPUT DECK".

I DO NOT HAVE the extended VHF TX MODE FOR OUT OF USA 2 meter band. I
know this is possible because I have heard several other hams talking
about it but I need to know. I have heard a rumer (semi reliable) that
Removing Jumper #60 that is right next to Jumper #59 on the top of the
main PCB and cutting jumper # #W4 which is just inbetween #D57 and D72
on the Main PCB (center of pcb).

I want to hear from anyone that has done this succesfully befor I
undertake the mod. I am possitive that this mod exists . Salesmen at
the local Ham stores find it easy and safer (want to keep their jobs)
by simply denying that there are modes when they have done them
themselves!!! DO NOt take their word for it! STEVE NS1R

Ed and James,

In reality, it is only necessary to sample at 2 times the INFORMATION bandwidth. SO... with the IF of 9 MHz and an audio (assuming something like SSB or AM or CW) bandwidth of a few kilohertz, you would only have to sample (theoretically) at 2 times that bandwidth. Now, this is how we implement modems that run at IF's of 70 MHz and sample at only 10-20 MHz, with data rates of up to 128 kbps. The tricky part is sample such that IMAGES of the IF do not fall into the passband of the 'sub-sampled' signal. (This is called sub-sampling by the way). For audio signals like SSB etc, you could sample at a few MHz, then decimate to several 10's of kilohertz (like 10-20 kHz) and do all the audio recovery/processing with a simple (Analog Devices type)DSP chip. By the way, sub-sampling also gets you a 'free' down-conversion too!

I am surprised no Ham gear is built this way yet. It has become very inexpensive. Almost all satellite comm gear is now built this way. I have built a complete satellite modem for about $500 (tx and rx). This would be much less expensive with a 9 MHz type system.

From: gwilliam@xnet.com
Message-ID: <4akgih$j98@flood.xnet.com>
Source record: 208978
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

I am a non-ham who needs to buy a 500 W dummy load (for 13.56 MHz, preferably with a BNC connector) for an experiment in an industrial setting. Needless to say, I need this soon (like tomorrow). Can anyone tell me a ham store in the Chicago area (North/West would be preferable but not required) or a mail-order outfit that would be able to supply this item quickly? Alternatively, does anyone in the Chicago area have one that they could lend (rent) to us for a few days? Although it might be possible to build a dummy load relatively simply, I would prefer not to do that for reasons of repeatability (we may need to repeat this experiment in another location with different equipment at a later date.)

Any help would be appreciated.

5453. Re: Gripe about QST Automatic Tuner Article

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-12 00:00:00 UTC
From: rwa@cs.athabascau.ca
Message-ID: <4aklh6$j5j@aurora.cs.athabascau.ca>
Source record: 208980

James Garland <garland@ohstpy.mps.ohio-state.edu> writes about a microprocessor controlled project featured in QST for which the source of the controlling programme isn't available. He isn't impressed. I'm not either. The article is only half a project. I guess I'm not going buy the kit. I hope the people at QST interpret that message properly.

Another question is: what does the author think he's protecting, anyway? His app code is intimately tied to the hardware. It isn't the least bit portable; it's worthless without the rest of the tuner. A copyright notice with a restriction on commercial use ought to more than protect any future non-amateur return the author might achieve, IMHO.

(I'll add in passing that the programme probably isn't any great big deal either. I've owned two autotuners, and they solve the autotuning problem with about a half-dozen $0.15 opamps. The manufacturer included a full schematic with each one, too.)

5454. Motorola MCX-100 programming

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-12 00:00:00 UTC
From: hcooper@vidiot2.corp.es.com
Message-ID: <4akn6u$39u@vidiot2.corp.es.com>
Source record: 208981

I have a Motorola MCX100, a 16 channel VHF mobile, that
requires a prom to be burned with the programming data.
I have an "instruction" sheet, so most of it I can
figure out, but the info on setting up the channels
to scan is pretty sketchy. I dumped the existing prom
contents (but lost them when I tried to go from the
Unisite to a floppy - didn't set 'b') in hopes to get
some usefull data. I'll have to pull the prom again
and read it, again.

So, does anyone have a little program already done that
sets the bit pattern so scan can be enabled on all the
channels ?

If, and when, I figure it out, I'll post the results for
all that care.

Message-ID: <Bruce_Kay-1212951733030001@uhuru.cog.brown.edu>
Source record: 208985

I am trying to set up my shack, and seem to be running into some RF ground problems. I've got about 20 ft. of 10 gauge copper wire running out of my basement to a ground rod right outside the window (same rod used for the house's electrical system). In the shack, this is connected directly to my antenna tuner and thence to my rig (Kenwood TS-520 soon to be a TenTec Corsair II).

Am I doing something stupid here?
What do other people use?

Any comments appreciated.

No, they cost more and have a lower plate dissipation rating. The "W"
is a ruggedized version of the 6146A that became available before the
6146B was introduced. They were factory-installed in Collins
equipment and are often purchased as replacements for that use.

Well Gary you may have stuffed your foot in it here. Note the difference
between CTCSS and DTMF. Most newer radios have a CTCSS encoder if they
cover 10M so they can access 10M FM repeaters. And the 706 does.

DTMF is something else. Icom makes a microphone with DTMF encoding
(only). This will allow the 706 to transmit DTMF codes for the repeaters
that need it. But the 706 cannot decode CTCSS or DTMF off the shelf. So
Mr Fiber is correct.

The HTX-202 works very well with packet. I use it with the KPC-3. The
wiring is fairly simple, you will need to insert a capacitor and a
resistor in the wiring. All the instructions come with the KPC-3. You will
also probably need an external antenna for further range, and also to cut
on computer interference.

5466. Gripe about QST Automatic Tuner Article

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-12 00:00:00 UTC
From: James Garland <garland@ohstpy.mps.ohio-state.edu>
Message-ID: <4ak5sr$oeo@pacific.mps.ohio-state.edu>
Source record: 208993

This month's QST features a slick microprocessor-controlled automatic antenna tuner. The design seems solid, and the price for the parts kit ($158) is reasonable. However......the article discretely mentions in a footnote that "the source code is not available," for programming the microprocessor. In effect, therefore, the article is simply a promotion for a antenna tuner kit, and not a do-it-yourself article.

I feel strongly that QST should not publish construction articles unless enough information is provided for readers to duplicate the project themselves. It is fine for an author to sell a parts kit with his article, but I do not believe proprietary information essential to completion of the project should be withheld. When lengthy software listings are involved, they should be made available on the ARRL Web Page or BBS, as in the excellent DSP kit by W9GR, a few years ago. I believe QST is setting a very unfortunate precedent with this article.

5473. TNC to Realistic hand-held?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-12 00:00:00 UTC
From: droll@cableregina.COM
Message-ID: <199512120132.RAA20370@UCSD.EDU>
Source record: 209000

I'm just starting to get back into radio, due to cost restrictions i'm purchasing a Realistic HTX-202 VHF handheld transceiver. I would like to get into packet radio on a low end, so my question is, is it possible to hook a standard TNC into this hand-held? Also any other infromation on this particular set-up or in general would be greatly appreciated.

Thanks,
David Roll

5474. Re: Icom 706 TX Mod for 135 to 175 mHz, cont.

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-12 00:00:00 UTC
From: stever@raven.cybercom.com
Message-ID: <4aik3i$kdj@crow.cybercomm.net>
Source record: 209001

The following looks almost like a packet message that appeared about a month ago on a local bbs...it was from I believe a South American station claiming the D59 mod is not the entire mod.and that a transistor and a trace cut was also needed for full change...This message was out before the 706 was available in the US..anyone else ever see that one? I wish I saved it...It might still be around..

Why would Icom make it that difficult or short-sited to hinder Mars members (myself) from making the mod? I don't have the 706 yet, but wasn't too concerned about the VHF because I thought the original 2 meter band had enough extra to cover the Mars freqs..Guess not!

I have no problem with smd's, but glad I don't have the radio without the schematics yet..I'll wait till it is available now..

From: lanceh@a.crl.com
Message-ID: <4aipbu$k93@nntp.crl.com>
Source record: 209004

I have a few comments about the following excellent article. Just a
little clarification here and there.

>All types of battery packs are automatically
>recharged when connected to the transceiver and
>power is applied to the EXT DC Jack (J2004). It

Cells installed in the optional holder designed for non rechargable
batteries are not recharged to prevent dammage. That holder does not have a
charge contact.

Also, the comment was made further down that batteries should not be
recharged till they reach .8/cell. Modern NiCads do not exhibit much memory
effect any more. Unless the cells are discharged to the same point over and
over again, memory isn't a problem. It would not be recommended to put the
radio on charge every night, but neither is it recommended to waste battery
life by discharging un-necessarily. Also, it is not wise to discharge a "pack"
that has been sitting for a long time, or hasn't been fully recharged
recently. This can lead to reversing polarity on the lowest capacity cell, or
the one with the greatest internal leakage. Applying reverse polarity this way
can cause cells to short. An occasional full discharge down to built in shut
off voltage of the radio (.8 - 1. v/cell) is healthy for the pack, but ONLY
after a complete recharge at no more than 1/10c rate (14-16 hours). This
insures ALL cells are fully charged and "should" reach the .8v point at the
same time.

Another point is that while mild overcharge at the 1/10c rate will not
do any harm, it should be avoided whenever possible as overcharging causes a
voltage depression that "looks" much like "memory effect". Leaving the
batteries on a 1/10c charge for a day or so won't harm them, but avoid doing
it on a regular basis to insure maximum battery life.

My personal policy with all types of rechargable batteries is to
recharge when they no longer have enough energy to insure I make it to the
next recharge oportunity, or when planning an activity where I want to be sure
I have maximum power available.

Hope these points help, and thanks to the original author for the time and
effort put into the original, informative article.

>Before solid state HF rigs came into being, some rigs were made using
>TV sweep tubes as the final. I read that TV sweep tubes had a number
>of advantages over RF output tubes but these advantages are never
>specified. Anybody know what they are?

Used to be an availability issue. TV sweep tubes were more readily available in the open market. Almost every neighborhood drug store had a tube tester and stock of tubes. However that advantage went the way of the buggy whip with the advent of solid state television. Sweep tubes have, on average, have a higher interelectrode capacitance than your typical power tubes. This results in lower power output at frequencies above 20 meters. For instance, the Drake T4/X with two sweep tubes in the final can outperform the TR4C transceiver with three sweep tubes in the final running the same input power level. Yet both rigs run 6JB6 sweep tube finals.>

5482. Re: TR7 Value ???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-13 00:00:00 UTC
From: James Garland <garland@ohstpy.mps.ohio-state.edu>
Message-ID: <4an77n$gdm@pacific.mps.ohio-state.edu>
Source record: 208859

In the U.S, a TR7 in good to excellent condition, with power supply and speaker, and remote VFO, goes for about $600. A TR7A is worth maybe an additional $100, Optional crystal filters are about $50/each. Local market conditions vary, so the value of a TR7 in Portugal might be far different (probably higher).

You're right. I was guessing. Not that $100 or something similar would pay for the effort involved. I don't have any specific comments on the rest of the included text. I can see the valid points made. I guess I was mostly disappointed with what I felt could have been a real learning experience for myself. I built the SSTV interface board article a few years ago. Remember that he offered the software free to anyone who sent him a picture of their completed board. None of the parts needed to be bought from the author, most of mine came from Radio Shack including the blank pc board which I was surprised to find there. I'm not interested in SSTV, but I built it because the fellow did that, was so nice to do it that way, and for the experience. I sent a couple of pictures. I did however generate a lot of discussion on the air about it. Maybe it did him some good.

5486. Re: IC-706 Microphone

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-13 00:00:00 UTC
From: Paul_N_Nix@aud.alcatel.com
Message-ID: <Paul_N_Nix-1312951404190001@paul_nix.aud.alcatel.com>
Source record: 208863

Regarding his new IC-706 mobile installation, Colin Wright (AA0YT)
has written:

> Has anybody tried making a "extension cord" for the mike: a pair of
> RJ45's, a RJ45 cable splicer (i.e., two females), and eight-wire phone
> cable?

> Thanks!!
>
> Colin R. Wright, AA0YT
> aa0yt@mo.net
> http://walden.mo.net/~aa0yt

In the 'food-for-thought' category, I called Heil Electronics the
other day, as I'm building an interface to let me use their headset
with my new IC-706, and I have to build an adapter cable.

The lady at Heil (VERY nice; reminded me of the good folks at Tentec)
said that they're having a terrible time trying to find the right cable
that will accept the 'modular' telephone RJ-45 connectors (used on the
IC-706), that is shielded. She said they'd finally found that if they
keep the unshielded run VERY SHORT it works OK.

Heil says they also frequently find that using their microphone
elements with ICOM radios results in very low levels, ie. some form
of audio preamp is needed. Along these lines, I've taken a little
one OP-AMP mic preamp from the ARRL Handbook, and already have all
the electronic parts to build it.

One thing I realized, while studying the IC-706's schematic (I called
ICOM for one) ... although long-time ICOM owners probably all know it,
but ... ICOM has +8 Volts DC on their microphone line, to power the
built-in mic preamp that's in their electret microphones. They make
NO mention of this in the IC-706's Manual (only cautioning against
shorting the +8 VDC line that's available on the modular connector).
The +8 Volts in the IC-706's mic line comes off an internal +8VDC
regulator in the radio, through a 1 k resistor. While talking to Heil,
the lady there said they use a 0.47 microFarad DC blocking capacitor,
to isolate their dynamic microphone element from the DC voltage.

Another thread for the 'factory repair' thread......

I had an Alinco DJ 580 which had an intermittent problem of memory dumping and display dumping. Sent it back 6 (Yes, SIX) times. On one trip, they swore that there was no problem and returned it to me after having performed an 'alignment and adjustment' at no charge to me. Well, same old sh*t. Sent it back to them. Called and verbally announced my disgust with them. Grant, the customer service rep (at the time, they seem to change) told me to settle down, that they would send me a brand new 580 to resolve the year long problem. Waited. No radio shows up. Call them back. Grant says that no more 580's are available, and would send me a DJ582 as a replacement. Waited. No radio. Called them back. Grant, (who, though cordial, is apparently a busy fellow, making all sorts of promises on the phone) said that his superior had vetoed his decision and that they had found a 580 to send me. Eventually, a different 580 (wrapped in a plastic bag) shows up via ups. No box, no accessories, no warranty, etc, etc,.....but at least it seems to work. I still use and enjoy my Alinco equipment (eight radios and lots of accessories) but I sure dread having to send anything back to them. Had I foreseen this years ago before investing so much $$$ in so much Alinco gear, I would have probably have chosen another system to use. My $.02 worth. YMMV.

I did not see the original post. From comments it looks like problems with oscillation on 10-15 m. A quick fix would involve installing a .01uf bypass to end of bandswitch assembly to AVR line on adjacent plug. AVR is the top first wire on the three wire plug adjacent to TX/RX diodes and Bandswitch. This has been more reliable than from connector to ground foil on bottom foil side of RF unit.

I cannot tell you how much this frosts me. If your group cannot troubleshoot the controller not responding to DTMF, then turn the repeater off and burn your licenses. How did you ever get that extra class license anyway?

Take out the schematics, get out your oscilloscope, and make sure that audio is getting to the dtmf receiver chip. ACC has used SSI-202 (Silicon Systems) and M-8870 (Mitel or Teltone). When a tone is received, the DV lead on the SSI 202 or the STD lead on the M-8870 should assert. If it does, then the problem is likely in the logic between the DTMF receiver and the CPU. If it does not assert, then the problem is in the DTMF receiver circuitry. Make sure that the 3.58 MHz oscillator (crystal attached to the dtmf chip) is running, and on frequency.

Hi Tom here... The Ft-101F is just the last version of that
same 101E model; before they came out with 101ZD models.... Its only
real <?> improvement I can remember was a better adjustable N.B., not
that it worked that much better.... The N.B. board had a different series
number an the rest of the boards were the same as any late model 101E.
Hope this helps.... <If memory serves me right it also didn't come with
11 meters in it, but neither did the last runs of the 101E>

Source record: 208872

I'd be a little concerned about sharing the house ground and 20 feet =
from a basement shack seems a bit long . . . am I wrong?

I have a different case, I'm on the second floor and prefer not to =
drill holes thru the wall, so I bring everything in & out the window. I =
run a copper pipe along the inner wall of the shack & ground everything =
to that, including a large steel desk.

I also have a 5 wire rotor cable roughly cut to 1/4 wave on 160, 75, =
40, 20, 15 that connects to the ground connector on my antenna tuner =
(this was originally set up to bleed off rf getting back into the shack =
from a long wire).

And finally, the whole grounding system runs thru a capacitor =
bypassed length of old coax down the side of the house to a grounding =
rod.

The next step will be to provide a knife switch to open the open wire =
feed, or perhaps to ground it, and maybe even quick disconnects for the =
coax and rotor control lines to also either open or go to ground.

Ok people, is this all overkill, or good grounding & lightening =
protection protocol? Suggestions encouraged!

> MHz apart. The 10.7 MHz WBFM IF is so wide, and even moderately strong
> stations drive the rig into intermod, that this problem severely limits
> FM BC reception. OK, 10.6 and 10.8 MHz spacings must be quite a few miles
> apart.

Here in Helsinki area we have one 300 m tower (YLE) with at least five high power BC transmitters (50-60 kW ERP) and a few lower power transmitters. It is about 8 km from my QTH.

The local commercial stations have a common 100m tower with at least 3-4 transmitters, about 8 km to the other direction from my QTH. The field strength from the YLE is about 20 dB higher than from the commercial stations (60-70 vs. 40-50 dBuV with a short whip).

There are two pairs of high power stations with 10.5 and 11.0 MHz separation. Lower power pairs can be found with 10.9 and 10.7 MHz separation.

Some of the lower power stations are nearly impossible to hear with the IC706. If you attenuate the signal enough to remove the intermod, the real signal is too weak. With careful pointing of the 2 meter beam it is possible to attenuate the interfering stations enough to receive the weak one.

However, last week I took the rig to the central Finland and again just 2-3 km from another YLE powerhouse. Fortunately the 4 transmitters did not form any pairs close to the 10.7 MHz separation.

The receiver was almost acceptable in those conditions. There was just not much to listen to there...

> I've added a high-pass 88 MHz filter with nulls at 70.8 and CH 4 and 5
> video carriers; also a trap tuned to one strong local FM station. Now I

> Lots of intermod on FM BC, even with the attenuator switched in. I get
> the impression that the LO inject level may be inadequate.

I have been planning to connect a lowpass 80 MHz filter to receive the 66-73 MHz East European FM band. Now it is OK with NBFM but covered by

intermod on WBFM.

Would need a few coaxial switches to use separate filters for all of the VHF segments. Or a controller sitting on the CI-V bus and switching the relays or diode switches automatically.

I would call TenTec anyway. They'll let you fix it yourself and they might know a chronic problem. Circuit cooler from Radio Shack will let you isolate the sensitive part or bad solder connection if it comes to that.

I have two of the Master II's on UHF. If they are the same configuration I think you can just pull the PL board out of the radio. As to the power, most people using the Master II in repeater service run them at 40% of max for full duty cycle. You might want to call the folks at Link Communications, the repeater controller folks, they have a fact sheet for converting the Master II to full duplex service.

I had the exact problem with my HTX 202. I returned the radio to Radio
Shack and they replaced the radio with a new one. It turned out to be
that the earlier serial number radios were more prone to PLL unlock when
using the higher voltage/wattage batteries.
Just my 2 cents worth.

>Before solid state HF rigs came into being, some rigs were made using
>TV sweep tubes as the final. I read that TV sweep tubes had a number
>of advantages over RF output tubes but these advantages are never
>specified. Anybody know what they are?

Fun topic!

The RCA tube catalogs of the early 60s have spec sheets on a large number of sweep tubes. In RCA, ONLY the 6LQ6 series were characterized for other than horizontal-output (pulse) service - in the 6LQ6 case the plate dissipation was specified as 200 watts for 15 seconds (or close to that...) All others were characterized only for horizontal output pulse service (pulse rate about 15750 Hz, pulse duration in the microseconds).

I believe sweep tubes were designed into a number of 60s era radios due to their low cost at the time ($3-4 each), decent plate dissipation (most sweep tubes have plate dissipations either in the 17 or 33 watt ranges, the latter comparable to the 6146B type), and reasonable working plate voltages (650 or 950 volts respectively).

A number of amplifier designs based on sweep tubes appeared in 1960s era ARRL handbooks, QSTs, and other publications. 4, 6 (or even 10) tubes in parallell, usually grounded grid, were common, with relatively low DC plate voltage (900-1000V) and relatively high plate current (0.5-1.5 amps) compared to other "real" transmitting tube designs of the day. These lower plate voltages allowed use of less expensive plate tuning capacitors and other parts, as well as power supplies that could be built from salvaged color TV power transformers and "computer grade" electrolytics.

The 6LQ6 series was designed into a large number of CB type linear amplifiers. They (6LQ6 type tubes) are now in very short supply and are quite expensive. Per-tube costs range from $8 to $40 depending on type, demand and vendor. Antique Electronic Supply flags most of their sweep tubes for a significantly reduced warranty coverage (except for the 6JU6 which is a sweep tube but they for some reason didn't catch it, and don't flag it as a sweep tube in lists). I converted a Dentron GLA-1000B amplifier (4-6LQ6) to use four 31LQ6's, which worked out very well and allowed me to re-tube for about $35.00.

Some people have converted transceivers from sweep tube output to 6146B output tubes. A few have converted to other filament voltages to allow for use of lower cost tubes. Most sweep tubes use either a 9- or 12-pin compactron type socket (the sockets are still available thru mailorder). When converting from one sweep tube to another, pay attention to claimed maximum ratings, particularly plate dissipation and maximum plate voltage.

The glass envelopes and anode connector/seals of sweep tubes aren't really suitable for transmitting service. Failed or inadequate forced air cooling can result in a sweep tube resembling a raisin and having about the same output power capability. Neat to look at, lousy to transmit on.

73 Dave WB0GAZ dgf@netcom.com

(and somewhat of a sweep tube fan!)

Before solid state HF rigs came into being, some rigs were made using
TV sweep tubes as the final. I read that TV sweep tubes had a number
of advantages over RF output tubes but these advantages are never
specified. Anybody know what they are?

: Yes, it's possible. The KPC-3 includes a diagram for wiring
: the cable, or you can buy pre-wired cables. I understand that the
: range is very limited, though. An external antenna should help.

An external antenna WILL indeed help. AN the 202 works JUST fine on
packet. Been using mine for a year now. MFJ makes pre-wired cables for
$15. Tucker sells them also.

This radio looks like exactly what I want (when I can afford it, and have got my A).

But why do all these new rigs have to be mobile size !!

I'd much rather have a big rig where the functions aren't hidden down menus and behind function buttons !!

(Still want one that runs on 12v though. I like the idea of being able to run off batteries for portable work !)

>need of advice or parts"
>11). Icom "rig at service factory right now. Icom postcard says est.
>turnaround time 45 days"

About five (?) years ago my IC-02AT went dead because the 5.12 MHz
synthesizer reference crystal stopped working. I called Icom for the
part after looking locally for an off-the-shelf part; I needed the
rig fairly soon for a big public-service event. I sent a check in the
mail and got the crystal.

I put it in and the rig still didn't work. But I was working on it at
someone else's workbench with limited time, so every night when finished
I had to reassemble the rig, and then disassemble it the next night to
work on it.

The third night I opened the rig (carefully, of course) and the flexible
PC "board" connecting the halves cracked, ending my efforts until I could
get a new one. Just for grins, I took the new crystal out of the radio
and subbed it into a microprocessor board nearby. The 6 MHz crystal out
of the uP board oscillated in my radio; the new 5.12 MHz crystal from
Icom didn't oscillate either in the radio or in the uP board.

I called Icom, suggesting that they owed me a crystal AND a flexy
board. The nice lady told me to send it to them and they'd repair it
FREE. I asked her to repeat that. She said to send it to her attention
and she'd see that it was done quickly because of my time constraints.
I shipped the radio UPS 2nd day with a letter reminding them that they
told me they were repairing it FREE.

It was supposed to be fixed the day after it arrived, so after five
days I called to ask about it. Nice-lady wasn't there; technician knew
nothing of any special-handling orders. He looked it up and it was
sitting on a shelf (it had arrived the next day) waiting to be fixed.
I reminded him what I had been told and repeated that I was told it
was to be done FREE, that they should return it if they wanted to
charge me for it; he said 'no problem' and said he'd fix it the next
DAY.

It arrived several days later (was shipped four or five days after
I talked to tech, if I remember right)... UPS *COD*, seventy-something

dollars! The invoice had nasty comments about the terrible job I did soldering (WHAT soldering? I UNsoldered the bad parts, and did a damn neat job of it after what was then 25 years of professional electronics repair experience.) and how I generally messed up everything.

I stopped payment on the check I gave UPS and followed up with a letter rehashing the situation. Icom never answered me.

I got rid of the radio soon after, and I now own a nice Alinco.

Unfortunately, nobody answered wrt the first category.

For the second category, all replies were different variants of
Ten-Tec. The Corsair I & II (no longer made) was mentioned by one.
Another mentioned that the Omni series also uses non-proprietary
components except for the programming on the EPROMs. I will have to
check into the likelihood of obtaining the programming on disks and
see if the modern Ten-Tec rigs are indeed completely off the shelf.

From: pepperb@gov.on.ca
Message-ID: <4amuda$a7n@govonca3.gov.on.ca>
Source record: 208936

Hello - does anyone have an idea of what the relative power level out at my watt meter should be for a Yaesu FL-2100Z linear amp?

Book says 1000 input, so I wondered what the generally efficiency was overall in the amp. Perhaps I expected a bit more, but about 500 w output is being seen at the meter, this is with about 90 watts drive (more can't be given, as the protection on the exciter cycles it off if I try to send more input to amp). NO ALC is being given to the amp, as the exciter as no provision for ALC output.

Thanks.

Brien

Source record: 208937

It's ARTICLE No. 95-11-3 for all 95 Ford trucks and some cars.

The biggest factor (that was missed in previous postings here) is
The very long ground return lead from fuel pump to engine compartment.

This can be as much as 10 or more feet in larger trucks. Great antenna.

Grounding this lead to frame at closest point to fuel tank is absolutly
necessary.

>
>
>Looking for any mods for the Yaesu FT2500m, any kind is welcome,
>possibly i'd like the one for out of band transmit,
>
>thanks....
>
>Marc
>Ve2hps.

Well, I've spent considerable (maybe too much!) time toying with the FT2500M, and here's what I've found:

1) Hold down the A/N key while turning the power on. Now all the zeros that appear in the alpanumeric part of the display are slashed. Repeat the mod to revert back to normal zeros.

2) Hold down D/MR and A/N at the same time while turning power on. You will get a display that says CH-x where x is a memory location number. Now the radio can only tune to frequencies that are stored in memories, and not do manual tuning. Repeat the mod to exit this mode.

3) There IS a mod for OOB xmit, but it does in no way expand the receive range. I'm not a CAP/MARS member, and I found this mod by accident (BTW, when hunting down mods, ALWAYS hook up a dummy load to the output!). Yaesu didn't put this mod in as a 'toy' or secret that people could find out for themselves, they intended it to make the radio useable for non-ham purposes by people authorized to do so. I won't personally give this mod out, but if you can prove to Yaesu that you indeed are licensed to transmit out of band, they will tell you how to do the mod. I'm not trying to belittle anybody by saying this; I just want to give some info on how to properly go about getting the mod. I don't have Yaesu's number handy, but their address is (from the back of my manual):
Yaesu U.S.A
17210 Edwards Rd.
Cerritos, CA 90701
USA
You could call information in California for their number, or better yet, call any radio store that carries Yaesu and ask for the number for Yaesu USA.

BTW, has anyone found out any mods BESIDES the out-of-band xmit/receive, DTMF decode, or OOB memory storage mod for the FT530? I have heard a rumor of an over-the-air clone mode, but haven't seen it yet.

Oh that is helpful.

Double check (by reprogramming ?) all COS inputs. One may be on that is
causing the controller to ignore the input you want to use. Most likely an
unused control receiver COS.

From: mfraser@vanbc.wimsey.com
Message-ID: <4anai6$sjg@wolfe.wimsey.com>
Source record: 208941

The EX309 has a parallel bus output. Most of the scan software
I've seen works with a serial port. The EX309 was discontinued
or taken out of the design by ICOM, and a different interface used.
I have seen nothing commercial that allows a serial port to be used
with the EX309. I didn't feel like learning about microcontroller
programming, which would have been necessary to build a serial converter
for this.

Maybe someone else can be more constructive, as I'd like to see the
way to make it work, too....

I Posted a similar article to yours a couple of weeks ago and got several answers about a book 40+ years of Mobiling that was written by the designer of the screwdriver ant. I understand that some machine work is required to produce almost all of the designs currently used. The best preassembled screwdriver hf antenna is supposedly made by a K4POZ, Ron Wilson in Atlanta, GA area. Ron is the Chief Engineer of WSB AM (50kw Braves BaseBall Flagship station) so he should know something about rf :> .

5541. New two way radio products (REPOST)

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-13 00:00:00 UTC
From: John Philpott <john@microcomm.co.nz>
Message-ID: <4ancg5$dgf@bclwn.bcl.co.nz>
Source record: 208946

New Products!!

MicroComm's Model 340 MicroLink Voice & Data Multiplexor.

The 340 MicroLink provides 3 radio channels and one data channel over
one conventional 25KHz radio channel.
In other words you can have 3 voice plus one data channel over just
the one radio channel.
It also provides a digital backbone for small networks.
MicroLink reduces the potential for site related interference by
reducing the number of RF bearers.
Applications Include:
-Rural telephone systems.
-Private mobile radio networks.
-Remote Controlled radio systems.
-Off shore oil and gas platforms.
-Rail communications systems.
-Scada & telemetry systems.

Prices from USD$5,185 a pair.

MicroComm Model 383 Repeater Tone Panel & Telephone Interconnect.

The MicroComm Model 383 is the most advanced repeater tone panel
combined with a telephone interconnect. It can simultaneously
decode/encode up to 50 CTCSS tones, 104 DCS codes and selective
signalling formats using DTMF or 5 tone Selcall.
The 383 can store up to 160 users in its database using any
combination of these signalling formats.
The optional plug in telephone interconnect daughter card provides a
fully featured radio to telephone and telephone to radio
interconnect.
Programming access is via local phone or remotely via the radio
channel or telephone interconnect using MicroComm's MS Windows based
package "FREND" (FRontEND)

Prices from USD$618

MicroComm's Model 681 Standalone/Network Tone Panel/Site Controller

MicroComm's Model 681 is an advanced state of the art concept in the
control of radio repeater and communications systems for the 2 way
radio industry. It includes all the features of the 383 plus many new
features never before found in traditional tone panel radio repeater
control products.

Fully expanded the M681 provides:

-Full repeater control port.
-4-wire E+M audio port.
-Pstn Interconnect with 2400 baud modem.
-Voice synthesiser.
-MPT1327 FFSK 1200/2400 baud modem.
-Digital data port.
-Voice band scrambling to/from interconnect or audio port.
-Comprehensive telemetery monitoring and alarm paging.

In summary, the M681 provides all the functions of a shared local repeater controller as well as providing full networking capabilities for linked repeater systems in a multi drop, multi repeater system, as well as concurrently supporting a full duplex telephone to radio interconnect.

Price from USD$815

Well, I hope Kenwood Service knows of this fix! I sent a (new to me) TS120 with the oscillation problem to them - they did some work, sent it back, and it still oscillates like a banshee on 15 and 10 (and most of the time on 20). Anyway, I've sent it back again and perhaps they'll look more closely.

Last time I fiddle with a TS120, for sure!

: was thinking of getting a paddle.

: There are a lot of models. Does anyone have a recommendations?

Here are a few that I've used:

Bencher - This one has been around a long time and is quite popular. Costs
about $69 for the basic model. The chrome plated and gold plated
models are more expensive. This paddle is a bit flimsy for my
tastes. It requires an allen wrench for adjustments, and I've
had problems with contact corrosion. Bearings are nylon and steel
needle bearings.

Jones - This one is imported from England by Palomar Engineers and costs
about $169. A very nice paddle. I have the all-brass model and
it's very solid--none of the flimsy feeling the Bencher has. The
bearings are rotary ball bearings with almost no slop or play.
It's fully adjustable without tools and the adjustments hold
over time.

There are many others on the market, but I haven't tried any of them. I
recommend the Jones paddle without reservation. It's one of the best paddles
being made today.

OK. Who cares about paying 158 dollars for a 100 Watt tuner KIT when the hamfests are cluttered with them for that or a few bucks more? The only advantage to this stupid article would have been the learning process concerning the algorithm in the programming of the micro. TenTec give a better description in the 253 auto tuner manual. No source code, but in their case it makes sense. This author is just another dealer, and I resent him using the club magazine for free (not only free but he gets PAID for it). He also forgot to thank the club members for a free 5 thousand dollar ad at the end of his article. By the way, now that the author knows so much about automatic antenna tuners he could probably get a job at Icom designing one of their 15 year old auto tuners. I think that demonstrates the value of this article since the author will not share the theory with us.

I an thinking about purchasing the FT-8500 and was curious about how rich the command language was for
controlling the unit from a computer through its RS232 port.

In particular, I was curious as to whether the FT-8500 could respond to a command which inquired as to
whether there was a signal on the current frequency (and perhaps provide some type of relative signal strength
value).

thanks!

I'm looking for any information anyone might have about price or availability anywhere concerning a rather old model of Ten Tec radio. I read a 1985 magazine review about the Ten Tec 2510, which was a combination 440MHz SSB/CW transmitter and 2m->10m SSB/CW transverter intended for OSCAR communications.
I called Ten Tec today, and the gentleman I spoke with did not recognize the model. If anyone knows where I might find more information on this radio or if anyone has one they may be interested in selling, I would appreciate an e-mail.

Thanks in advance.

I've purchased several radios from OKCC over the years (they have a nice store in Oklahoma City, as well as come down to the Fort Worth-Dallas area Ham-Com each year, too!), both new and used, and have been completely satisfied with doing business from them. They're nice folks to do business with.

Interesting ! I was under the impression that QST (ARRL) was very
explicit about not accepting construction articles in which the author
witholds proprietary information. This is dissapointing...I haven't
seen the issue yet but the project sounds quite interesting to me.
I guess the author wants you to buy the complete kit *or* at least a
preprogrammed micro with the security bit set (so that you can't copy
'em). That's the kind of nonsense you see in Popular Electronics.
Maybe QST and/or the author has made an error :)

Hey all,
I recently learned how to scan the 800 range using my cellular phone from Motorola. I also learned how to transmit over the 800 range, making my cellular phone into a NICE duplex two-way radio. (My friend has another phone, and we use them to talk back and forth, in programing mode....) Anyways, the range for a clear transmission is fairly short, and I was wondering if there was a way that I could put an amplifier on my antena, so I could transmit with ALOT of power, and maybe receive weaker signals. I WILL TAKE ANY IDEAS! Please E-Mail me. THANKS.

>Low plate voltage, high mu and low drive power.
>Disadvantage: bad linearity so distorsion with SSB.

This statement is misleading. The right sweep tubes in the right circuit compare very favorably with other devices.

The #1 advantage to sweep tubes is that for a given plate dissipation rating, they can provide a relatively large amount of peak current. This translates to greater power output in short duty cycle modes like CW and SSB.

The disadvantage is that this higher power output, as a manufacturer's spec, is valid *only* for those short duty cycle modes. For continuous duty work, such as RTTY, power input to the tubes must be significantly reduced to avoid damage.

I have not seen the 6146W however I would suggest you get the physical
specs for comparison as well. No sense getting the tubes if you can't
put the cover back on the gage.

Anyone out there that could answer the qestion of physical
compatability ?????

Brian Farrelly (Brian.Farrelly@nho.hydro.com) wrote:

: It strikes me that by decimating you are throwing lots of information away,
: information that might be useful for reducing noise. If you decimate from
: 9 MHz to the range you suggest then you are keeping only .2% of the samples!

: I presume there is a flaw in my logic somewhere but I don't see it!

Before we begin, someone made a big boob choosing the word "Decimate"
with its meaning reversed, back in the early days of DSP. To quell unruly
towns, Roman governors 2000 years or so ago, threatened to "decimate" the
population. If the population did not fully accept the Roman occupation,
the Romans took one tenth of the population (usually randomly) and
publicly executed them. 9 tenths lived on.

DSP usage blows it two ways, firstly their "decimation" covers all
factors not just ten, and it is the minority that survives. Also the
samples that don't survive don't just disappear, they influence the
output of the process.

Let's call it "resampling" instead

Samples aren't just thrown away, instead a filter is used to perform
amplitude interpolation. When changing to a slower sampling rate, greater
amplitude resolution can be created in something akin to averaging. If we
are going to collapse N samples into 1, we can average those N samples
and create a result that needs more bits to express it than each of the N
originals each needed. Averaging is a crude filter-like process. A
flashier filter could be seen as a form of weighted averaging (a pretty
good way of visualising some types of digital filters).

Some audio ADC's sample at MHz rates with a 1 bit ADC (comparator)
and then "Decimate" to give 44.1 kilosamples/sec with many bits of
resolution. They also use a one bit DAC as a feedback element into a
multiple integrator structure preceding the 1 bit ADC. Look up
"Delta-sigma Analogue to digital converters" for more info.

Nyquist's sampling theorem (he did other things besides sampling)
gives a minimum sampling rate for UNAMBIGUOUS capture of the information
in a signal, given the BANDWIDTH of that signal. Centre frequency is
irrelevent to this, bandwidth is what counts.
From this it is possible to sample a signal at a rate greater than
twice the signal's bandwidth - though possibly much less than the
centre frequency - and capture all of the information in the modulation
of the signal unambiguously, but losing certainty about the centre
frequency. This is called undersampling

Now, it's possible to amalgamate undersampling techniques with delta-sigma converter techniques and wind up with what is now called a "bandpass delta-sigma converter" These things haven't really hit the streets yet, no semiconductor manufacturers have flooded the market with parts and applications notes, published info is in the form of research papers aimed at those already in the know. I know how they work in general terms, but haven't yet felt the need to dig into them seriously as they do not, at least now, offer the combination of bandwidth and bits of resolution that I'm interested in.

Cheers
David GM4ZNX

5571. Re: FT-1000

Newsgroup: rec.radio.amateur.equipment

From: James Garland <garland@ohstpy.mps.ohio-state.edu>
Message-ID: <4aq35g$pqu@pacific.mps.ohio-state.edu>
Source record: 208818

I've used an FT1000D for several years, and think it is the best transceiver I've ever used. It is vastly better, in my opinion, than the Icom 765 which I used previously. LOaded with all the filter options, the FT1000D selectivity is exceptionally good, with bandwidths well-shaped for the cw user. The tuning rate is a bit fast for cw work, but you can buy an aftermarket accessory which slows it down. THe sub-receiver is very useful, although I miss not having an s-meter for it. I never use the internal keyer so can't comment on it. The QSK circuit seems to work well at 40wpm (my limit), but I don't really care for QSK except in a contest or big pileup. THe strong-signal handling capability is excellent, although there is a PIN diode factory mod for improving it further. My FT1000D has been extremely reliable, with no problems whatsoever.

5572. IC-706 HFXmit D-59 Mod

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-14 00:00:00 UTC
From: ni8k@aol.com
Message-ID: <4aplav$ii0@newsbf02.news.aol.com>
Source record: 208819

This is the 50 Mhz and down Xmit Mod.

Caution: You will be working on a surface mounted, very small device.
Be sure you have a strong magnifying glass and a strong bright
light.
To remove the device you will need a small soldering pencil and or
dykes.

1. Place the radio front knob towards you and remove the top 3 and 2 side
screws.
2. The main board is the one near the front.
3. The 706 has 5 diode spaces on this main board. These spaces are located
just to the right of the orange ribbon cable connection and to the
left of part
R-198 marked on the circut board.
4. Now that you have found the 5 small spaces; you will see from left to
right
small 3 legged black diodes in positions 1, 2 and 5. On my US model
diodes
for spaces 3 and 4 are missing.
5. Next we want to remove unmarked diode D-59 which is the second diode
from the left. You can use a small soldering pin or you might want to
just
cut it out of the way. I was able to unsolder the front two legs then
raise the
diode and unsolder the front leg.
6. Now your done ! Re set the CPU and you can transmitt below 50 Mhz.
It works.

2nd Caution: If you are not comfortable working with very, very small
devices
find some one who is. This is too expensive a
radio to screw
up and trust me- it wont take much.

Removing this device (diode) might disable further mod's and will
void your
warranty. Thats another reason to unsolder and keep the diode.

This mod works and I have noticed no side effects or strange
problems.

Now I can use this radio as a back up MARS Station.

You'd _better_ average these together, or you'll get aliasing.

I once had occasion to compare a really high-quality sampled & reconstructed
256x256 image with a run-of-the-mill sampled & reconstructed image that was
512x512. The difference was amazing. The poor slob was wasting 4X as much
processing to produce images that were substantially inferior.

The bottom line is: use high-quality anti-aliasing and reconstruction filters,
and you'll save yourself one heck of a lot of digital processin.

5581. Re: 6146B replacements

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-14 00:00:00 UTC
From: James Garland <garland@ohstpy.mps.ohio-state.edu>
Message-ID: <4apc4u$acg@pacific.mps.ohio-state.edu>
Source record: 208828

THe 6146/A/B/W tubes are all the same size. The B has a slightly higher plate dissipation (35W) than the others (25W), while the W is a military ruggedized version of the original 6146. If you need the ruggedness, as for a mobile transmitter, go with the 6146W. If you want to squeeze the last watt out of your rig, go with the 6146B. (Unfortunately, there is no 6146BW, so you can't get the best of both worlds.) Kevin Deal ((909) 982-2386) is selling new 6146A/B/W. The prices are 6146W=$11, 6146A=$12, 6146B=$19. Good used ones are frequently available at about $5-$8. If it was me, I'd go with new 6146W's.

James Garland <garland@ohstpy.mps.ohio-state.edu> wrote:

>If it was me, I'd go with new 6146W's.

Jim, the difference in the plate dissipation rating between the 6146W and 6146B is not slight. The 35 watt rating of the B version is a 40% increase.

Many rigs that were factory-equipped with a pair of 6146B's had power input ratings of 240 watts. The A and W versions of the tubes won't survive that power level for long.

Incidentally, I've known many hams who used the A and B versions mobile. None of them ever experienced a failure other than the tubes eventually becoming soft with age.

IMO, the W version was just one more inventive way for the military to spend its budget.

I have an FT-11R too. People who receive my transmissions report a
"humming" whose tone varies with the PL tone I set. Are your symptoms
the same?

Anyway, I called Yaesu about it. I was told that there's no *easy* way
to turn down the tone level unless you have the optional FNS-26 (?) tone
board. The hard way is to read the schematic (and somehow decipher the
internal functions of the major chips) and change a resistor or two.
(ie. Good Luck!) The guy gave no indication that Yaesu would do this
for you for any price.

Let me know if you find a different answer.

5596. Ten Tec preselectors

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-14 00:00:00 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <23971.818920785@safety.ics.uci.edu>
Source record: 208843

I just got an Argonaut 515. It has the preselector just like the older Argonaut 505, 509 ... and the Tritons and OMNI-D's.

I noticed that my Argonaut has low sensitivity on 75 meters only. The higher bands are OK. The receiver trimmer is fine, I checked it, so it seems that the preselector would be the problem.

Anyone see this problem, where the preselector is weak on one end of its spectrum? (This is an 80-10 rig, so 80 is the low end of the preselector range). Anyone do this alignment and have any suggestions?

Clark
WA3JPG

P.S. Also, anyone pick up a Ten Tec 8 pole filter and put one into the Argonaut?

Low plate voltage, high mu and low drive power.
Disadvantage: bad linearity so distorsion with SSB.

Brian,

Lots of references out there. Look into Harris Semiconductor DSP data books, plus trade rag articles like in EDN, Electronic Design, and RF Design. There are several books too on DSP, and IEEE articles.

The basic idea is to sample at a high rate, say several MHz, then decimate down to a reasonable bandwidth the DSP can handle, a bandwidth related to the information bandwidth. The key is to use a decimating filter. This takes in samples at a high rate and FILTERS LIKE A LPF to give a low output rate. THIS HAS THE EFFECT OF FILTERING OUT MUCH OF THE NOISE AND INCREASING THE OUTPUT SIGNAL TO NOISE RATIO BY

POTENTIALLY LARGE FACTORS. Think of it in the frequency domain - the noise is spread over the original sampling frequency range, then the decimating filter get rid of everything that is outside the OUTPUT sampling frequency range. Just like the narrow filter in the IF of every ham rig.

Source record: 208902

I compared SWAN-500 and IC-735 on the air. The SWAN received a consistent 2S better report and always unsolicited excellent quality reports. The Swan had two TV sweep tubes, and its input power was 350W CW and possibly over 500W SSB. Thus, the SSB output could be in the 300W category. Icom was just a 100W rig. The good TV tubes' peak ratings were excellent for SSB, for which the peak power means more than the average power.

My experiences with the two working DX on 80m could be summarized in one sentence: with the Swan, almost everyone could hear me but I could not hear them, and on the Icom I could hear everyone but they could not hear me.

I've managed to stay out of this, but the temptation has now overcome me :)

The comments that follow are related to how the tubes work in my particular single radio, a TS-830. I have operated this radio since it was new in 1981. It has performed fairly well, in what would probably be called commercial duty. Except for the first few years I had it, it has been in heavy digital service most of its life. It ran 2 years on amtor with a documented 800 contacts per year, averaging 43 minutes each. When I got into packet and needed an hf port, it was moved to that mode, and a different rig acquired to use for ssb/cw/amtor. It has run dedicated hf packet port service for the last many years. During this time, tubes were a great concern. There were many times that I couldn't keep tubes in it. I would replace them every few months. I had one pair of 6146Ws that I got from Surplus Sales of Nebraska, but they seems (as you said), a bit "stale". They just didn't seem to do well. I finally pulled them. What works? The plain old 6146A works best for me. It seems that 6146Bs run too hot and are too fussy. They are more apt to have parasitics (noticed this in vhf service in two way radios too), and don't last long. The 6146As that I am running right now have been in for over 2 years, and they are still running just fine. I have access to 6146B for free, but just can't keep them in the radio. I won't use them.

Just another wrinkle. Obviously, others mileage does vary.

5620. What equip needed for interpreting cw Morse

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-15 00:00:00 UTC
From: csshtri@tam2000.tamu.edu
Message-ID: <4asa2u$780@news.tamu.edu>
Source record: 208656

I'm an aspiring ham and I'm going to start "listening in".
I'm wondering what equipment I need to get one of my computers
to interpret morse code ? I'm under the impression a TNC won't
necessarily do this (though I also intend to get into packet).

At my disposal, I have a 386, running Os/2, 286 running Dos, an
inherited Commodore 128 and an itty-bitty TI computer. I'd like
to set up the commodore to do this, but am not sure on the
availability of ham or communications software for the commodore.

Any hints (heck, at this point, I'll take flames, too) would be greatly
appreciated.

-Steve

5622. Wanted: Mod TM-455a (Kenwood 430mhz allmode)

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-15 00:00:00 UTC
From: CConklin@softkore.com
Message-ID: <4aqccm$190_001@news.sbt.net>
Source record: 208714

The Tm-455a looks like a nice rig, nice specs all down the list, and a nice price. I figure the new price is a result of the relative impossibility of selling a rig that covers 430-440, but not 440-450.

Have not seen a mod for this yet- did Kenwould-not really do something as stupid as make an all-mode rig, with the A suffix (American version) that doesn't cover the 10 megs of the band that has 99.9% of the FM mode (all but repeater Links and ATV audio in this part of the country).

So if you throw out FM, and packet, you are left with a $600, 35watt SSB transceiver?? Questionable value considering Yaesu's Ft-790r2.

Also- does the Tm-455a do the "tranverter display" like the sister TM-255a? (That is display multiples of the operating frequency in the display LCD- real nice addition IMHO).

We have an fm station about 10miles away on 95.7mhz. The entire fm band is overloaded into a garbeled bunch of mush from there all the way down to 88mhz on my IC 706. This is not the case with my $9.95 pocket radio. It easily outperforms the 706. So don't expect much!

5624. AM reception in your teeth?!?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-15 00:00:00 UTC
From: liao@emedia.net
Message-ID: <liao-1412952015170001@jliao-b.liao.emedia.net>
Source record: 208716

here's a question i've been trying to figure out:
a lot of people claim they can hear AM transmissions through
their dental work or bedsrpings. how does this happen? obiviously,
the metalic structure of the dental work and the springs can act as
antenna's but what is demodulating the signal from the carrier?
and what is used to amplify the sound?

anyways, just doing some wondering.

if you have any ideas, it would be really nice if you emailed it
to me!

mucho gracias!

To all:

I have a Kenwood TM-742a for sale right out of the box with all
docs and warranties. It is only three months old . Included is the
DFK-7 kit, TSU-7 decoder, and the UT50s module for the extra 50mhz
band, and the Comet SSB-15 tribander antenna as a complete package
for $900.00 plus shipping. There is absolutely nothing wrong with
this unit and the accessories, it has very little TX time less
than an hour, and receive of not more than three hours.

5635. FM BC on IC-706

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-15 00:00:00 UTC
From: rcarpen@DGS.dgsys.COM
Message-ID: <Pine.SOL.3.91.951215142439.12823A-100000@DGS>
Source record: 208727

The summary review of the '706 in the November issue of the French mag Radio-REF does not mention any reception between 60 and 118 MHz, nor does it mention the 70.7 MHz WBFM IF.

Back then it had not yet received the French equivalent of FCC type approval.

Perhaps the French authorities demand that FM broadcast receivers meet some reasonable minimum performance level...which the 706 certainly can't. On the ham bands, fine...but not on FM BC.

My 706 is on its way back to ICOM to see what they can do about the FM BC reception. Unless they can somehow reduce the intermod, I doubt that they will accomplish anything.

ICOM says I'm the only person who has complained to them about the FM BC reception.

There are a lot of good paddles on the market (and a few crummy ones too). Prices vary widely.

I have a Bencher BY-1 that I bought new in 1978. Yes, it's not as heavily built as some of the others, but I've never had any trouble with it what-so-ever (I treat it carefully, as I do all of my ham gear). I have tried the Vibroplex Vibro-Keyer, Brown Brothers, Ham-Key, Viking Speed-X, and others (but not the Jones or Hi-Mound). I prefer the feel of the Bencher over all the ones I've tried, although the Brown Brothers was also quite nice. Unfortunately, Brown has been out of business for many years, and their keys bring a high price on the used market. The Bencher is a low-priced model (comparitively) and might be a good one to start with. And you might actually like it, as I do, and stick with it! I wouldn't use anything else. :)

BTW, I operate strictly CW, nearly all of it QRP. I run between 20 and 30 words per minute most of the time, and the Bencher keeps up with me just fine. I have been licensed since 1977, and have the Extra ticket.

5637. Re: 6 meter ten tec kit

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-15 00:00:00 UTC
From: QRP%mimi@magic.itg.ti.com
Message-ID: <4asih7$bk6@mksrv1.dseg.ti.com>
Source record: 208729

I have the T-Kits catalog right here in front of me. Let me
paraphrase from it...

Model 1208, Six-meter Transverter Kit, $99.00 (wired, $159.00)

The i-f is 14 MHz (20 meters). Will accept 3 to 5 Watts input
from HF transceiver on 20m, any mode. Not to exceed 5 Watts!!
Coverage on 6m depends on coverage of 20m rig. Typical power
output on 6m is 8 Watts. RF-sensed PIN diode T/R switching,
Fast enough for data communications. Requires 12 VDC @ 3 A.
Full coverage of 6m (50 - 54 MHz) requires a rig that covers
14 - 16 MHz (a lot of modern synthesized rigs can be modified
to transmit out of band, which would meet this requirement).
To work 6m FM, your HF rig has to be capable of FM operation
on 20m (many are not). Repeater offsets would be tricky. It
would require use of dual VFOs or memories in the HF rig to
accomplish this. BTW, they recommend not transmitting above
52 MHz (but don't say why in the catalog).

This is all the info I have. It's from their catalog.

I haven't talked with anyone who's built one of these, but I
have considered doing it myself. I'd like to hear more!

Hope this info helps.
73, Dean KC5NG

Good question. Now, believe it or not, this is a GOOD answer.
The best computer around for doing this is the one between your ears.
Start learning the code, sit down at the keys, and type what you hear.
That is the BEST way to make that computer copy code.

...and it isn't platform dependent, either!

You might find the 10 watt output on FM to be a little skimpy, and may end
up wishing you had more power. But I hear guys on them, and they sound
good through the repeaters. Also take a look at the Azden PCS 7500.
Pretty nice radio, 10/50 watts out.

But - be warned, once you have 6 meter FM, you'll want SSB! It's a neat
band. Have fun.

>experience with the rig and what you think of it.
>Thanks, Mike KS4DA

I have a tm-733a in my car and I use it extensivly. I strongly reccomend getting the tone decode board because the radio is very suseptable to intermod(that's useless unless the repeaters you use transmit tone, but it helps alot if they do) If you're going to use it a a base I just assembled my packet cable for it yesterday, (will post pin out next) and it okay on 1200baud, I don't have a 9600baud TNC so I cannot test it there.All in all though it's a perfect compliment to my th79a handheld and I love remoting it. I use one of the programable memoried to set the 733 into remote mode then i'm off..Have fun, if you have specitic questions post and i'll be happy to answer..'73

5647. Yaesu FT-736R AGC Problem??

Newsgroup: rec.radio.amateur.equipment

From: lloyd korb <korb@xraymkt.picker.com>
Message-ID: <1995Dec15.202315.1314@picker.com>
Source record: 208739

I have noticed an apparent AGC problem with my FT-736R. The only way I can describe it is there is an audio distortion in the slow AGC position when the RF Gain is set fully CW. If you back off the RF Gain pot until the S meter does not move, in other words, if the signal is peaking S9, reducing the gain to the point the S meter rests at S9 eliminates the problem. I'm wondering if it is an attack time problem. I also notice that with no signal input, just background noise, that there is a crackling noise until once again I adjust the gain so the S meter sits above the noise level. Does anyone with the 736 have this problem? Thanks,

Hello,

I have a Database Demo program which helps identify Radio Broadcast Stations. If you would like a copy, send your Email address and I will send the program via Email.

The program runs from DOS and is a stand alone program which needs no other platform to run.

It's easy and installs quickly..

Hope to hear from you.

Chuck Bolland

Message-ID: <819109797.17077@pinetree.microserve.com>
Source record: 208753

I'm posting this for a friend who needs a schematic for his receiver.
If somone could make a copy, I'd be glad to pay the costs.
Alternately, is anyone still selling repro manuals for this model?
Was there a service manual that's different than the standard owner's
manual? I don't know if Collins made changes through the production
of the 75A3, but this particular receiver is S/N 1200.

Thanks & 73,

Jack WB3U

>receive mode (am, (wide/narrow) fm, lsb, usb, etc).
>I also would like to be able to save to disk the digitized audio output
>from the radio.

Your best bet is probably not to look for an adapter card, but for a
synthesized-frequency reciever that can be controlled via a standard
RS232 port. If you want to digitize the audio, feed the output of that
into a soundcard and record away. That combination is more likely to
be available, doesn't require anything beyond standard device drivers,
is probably more versitile in the long run (you can run the radio even when
not connected to a PC), and so on...

Warning: Digitized audio burns huge amounts of disk space very quickly.
Unless you've got gigabytes and/or are only capturing VERY short samples,
I suspect that audio tape is a better solution.

5670. Fix your MFJ Mod. 986 Tuner before it breaks

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-16 00:00:00 UTC
From: rfreeman@earthlink.net
Message-ID: <30d23bc4.2953536@news.earthlink.net>
Source record: 208664

To all hams:

If you have a MFJ tuner Mod. 986, the shaft in the roller inductor may break at any time. The problem is the hole in the front panel is slightly higher than it should be so the shaft is bent all the time. To correct this 4 washers need to be put under the roller inductor to raise it to match the front panel hole. I drilled holes in four pennies and used them. They seemed to be just the right size. Doing this will save you the $55+ fee that MFJ charges for a new roller inductor when the shaft breaks.

Yes, MFJ is aware of this design flaw.

Post any questions.

Richard, KB6CEA

5671. Re: Where to get crystals?

Newsgroup: rec.radio.amateur.equipment

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I am just cross posting the message here to help Henry. The system is an old police base station we inherited for our ARES/RACES repeater. Henry verified it worked on the original 460 frequencies and was able to tune the receiver down to 447 MHz but hasn't been able to get the exciter working on 442 MHz yet. He has verified the power amp works on 442 MHz so the problem has to be in the exciter. Has anyone had experiance making a MOTRAC transmitter tune in the bottom end of the band? If you post your answers here or email them directly, I'll make sure Henry gets the info. Thanks for the help.

Give ICOM a call and they will send you a schematic for free. The service manual costs
$30 dollars and is suppose to be out in January.

What John doesn't know is that we replaced the coffee
he NORMALLY drinks, with a new, low-grade fiberglass.
Let's see what happens...

5682. Re: Limits to DSP?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-16 00:00:00 UTC
From: willco788@aol.com
Message-ID: <4atmgr$9s2@newsbf02.news.aol.com>
Source record: 208676

Anyone think about the real limits of DSP? I have wondered how
much a really powerful machine could do. Suppose we wanted to
do DSP at a "real" Intermediate Frequency, say 9 MHz. How often
do I need to sample to do a good job for DSP? How much of the
processor time would be needed for the algorithm? Can we ever
get there?

Clark
WA3JPG

How About this? It's software that runs on the Hamblaster.
The software also copies morse code and displays the text
on the PC screen.

"MOON", MORSE CODE FILTER APPLICATION PROGRAM

The Moon filter is a very sharp narrowband linear phase filter that's
adjustable to 1 hz bandwidth with a transition region of 1/2 hz providing
60
db attenuation. The very narrow bandwidth and high resolution tuning
of the center frequency provides audio filtering that is ideal for Moon
bounce and other low signal/ high noise applications.

The bandwidth is adjustable in powers of 2 providing a usable CW filter
down
to 16Hz and a maximum bandwith of 1024 hz. For normal code applications
64 Hz is adequate. The filter's center frequency is tunable from 100 Hz
to
3000 Hz in 0.1 Hz steps. Without touching the radio's dial, the high
resolution
tuning allows the user to zero in on the signal and by pressing "T" on
the
computers key board, the Moon filter will automatically lock (even during
noisey
conditions) to a CW signal.

The software takes advantage of the Hamblaster's codec (D to A, A to D
converter) which uses a 14 bit analog to digital conversion and provides

a wide dynamic range AGC (Automatic Gain Control). The Noise
reduction feature, using a "non linear process" (somtimes called a center
clipper)
reduces the noise floor and ringing when narrow filters are selected.

To invoke the program simply call the .exe file "MOON" from the DOS
prompt. The datafile "M00N.BIN" must be in the same directory as the

call is made from or in an available directory using the PATH or APPEND DOS commands.

Controls:

Menu selection is performed by pressing the highlighted letters in the displayed menu. Then depending on the menu choice use the up/down or left/right cursor keys to provide further selection. Unique keys are selected for all menu selections to allow jumping from any menu option to another menu option with a single key selection.

The following menu option controls are provided for the MOON Filter:

Gain: Used to control the signal level into the MOON Filter. The up/down cursor controls provide squelch, 0db, +6db and +12db gain when this menu option is selected. The gain selected is displayed by the number of rectangular blocks displayed.

Volume: Provides variable output volume (independent of the input gain selection). The Volume selection is made using the left/right cursor keys. Squelch, -12db, -6db and 0 db volume level is provided. The number of blocks displayed represents the volume level selected.

Center frequency: Provides a rapid way to increase or decrease the center frequency of the filter. The numeric keys 1, 2, 3 and 4 provide the jump frequency provided by the up/down cursor keys. The corresponding jump frequencies are 0.1 Hz, 1 Hz, 10 Hz and 100 Hz for the numeric key selected. There is no operator feedback for the jump frequency selected other than the frequency jump that occurs when the up/down cursor keys are selected when this menu option is highlighted.

Tune: When depressed the filter center frequency is adjusted when a signal is present to center the filter around in input signal frequency. The filter jump frequency used is related to the jump frequency selected using the numeric keys 1-4. This closed loop system may exhibit some instability if large signal is present and a large jump freuency is selected. In general use a low jump frequency to center the filter especially for the very narrow bandwidths.

Xchange: The exchange menu selection simple stores the current center frequency and swaps it with the previously stored center frequency. The default initial stored center frequency is 600 Hz. The exchange alse stores and exchanges the AGC setting for the exchanged frequency.

Bandwidth: When the Bandwidth menu option is selected the up/down cursor keys provide a method to change the bandwidth over the range of 1024 Hz down to 2 Hz (1 Hz for sample frequency = 4000 Hz). The bandwidth changes by a factor of 2. Finer resolution of filter bandwidth can be achieved by changing the sample rate.

Sampling frequency: When the Sampling frequency menu option is selected the up/down cursor keys provide a method of changing the sampling frequency over the range of 4 kHz to about 10 kHz.

Noise Compression: This menu option is particularly noticeable in high noise situations especially if narrow bandwidth filters are selected. The feature centercips or nonlinear compression of the signal is performed to cut background noise or output ringing due to noise energy being present in the passband of the filter.

AGC: This provides additional input signal gain or attenuation to provide optimum signal input for the filter algorithms. Some experimentation and experience is required to know when it is desirable to enable the AGC control. Momentarily turning on the AGC will cause the input signal to the filters to be optimized. Low values of AGC are best to be avoided by reducing the signal level from the radio. The optimum AGC signal level is between 80 and 127 for most applications encountered.

Morse parameters: Once a strong signal is received the Morse code decoder is enabled. The Morse code timing parameters are constantly being adjusted if the Morse parameters are allowed to adapt. While the signal is strong it may be a good idea to "FREEZE" the Morse code decoder timing parameters.

Display: There are two display options available by toggle the Display ("D") key.
1) The Signal/Tune screen allows observing the Signal and tuning parameter as a function of time. The tuning parameter indicate if the filter is tuned high or low when the signal is present.

2) The I&Q display provides a rotating display. When the signal is centered in the filter bandpass the display will stop rotating. The rotation frequency and drift are caused by the transmit and recieve local oscillator frequency.

Jim,

It is a very good kit. I built one this Fall. It even worked the first time!

Well, with the amount of instructions, you really can't go wrong. I found the receive portion much more sensitive than any other 6 m converter, I ahve built. I have built two more - one was a Hamtronics.

You do need some kit building experience, in my opinion, before tacling something like this. But it is well worth the effort.

Hope to hear you on Six in the Summer.

Reply to: n5off%w5ddl.aara.org@usl.edu or N5OFF@aol.com

To get a copy of the subject list, send an Internet message to:

listproc@theporch.com

leave the subject line blank

in the body of the message type

get boatanchors r390a.users

Thanks to all who have contributed R-390A info. We have data on over180 rigs from 17 contracts. The lowest serial number seen was 2, and the highest in a given contract was over 6000. Contributions include those from Dittmore-Freimuth and Fowler Industries contracts, as well as an EAC Industries consumer products run.

As I mentioned in earlier posts, I am compiling a survey of R-390A's owned by people who frequent the packet and Internet boards. The object of the
game is to try and ascertain how many contracts were let for manufacture, and how many were made.

If you wish to participate in the census and you own one or more R-390A's (or spy them on ships, hamfests, or just anywhere), please go take a peek at it (them) and then reply to me with this information:

1) maker (EAC, Motorola, etc)
2) order number (63-PH-54 for ex) from the front tag
3) serial number off of the front tag
4) any unusual features (tags, stamps, frequency shield, etc)

The list includes an accounting of the contributors, however, the names are not matched with the rigs. If contributors have a desire to sell their rigs, I'm sure they will speak up, so you won't get any cards or letters from making a data contribution to the list.

Thanks,

Add me to the list of satisfied customers - I called to order a used radio last tuesday, and it was in my hands on Friday (in Denver). The shipment included MORE accessories than they originally claimed, they didn't charge for shipment, everything was in excellent shape and well packaged. Definately pleased at this end.

Hi Greg,

I live a few miles from Oklahoma Comm Center and drop by often for a chat with Mike and Tony. They are the two guys you will most often deal with when calling on the phone. They are both knowledgeable active hams and are glad to share their experiences to help you pick out the rig that is right for you. I have never seen a better price on equipment or support for the buyer. I will admit that they are more geared for mail order than counter sales and if you walk into the showroom, you might wait awhile before they get around to helping you. If you are looking for reassurance, you have it. They are on the up and up and serious about selling you ham gear now and in the future.

P.S. - If you talk to Mike, tell him Glenn said he is a bottomfeeder. If you talk to Tony, have him pass the message to mike. o<:-)%

5693. Icom Batt on HTX-202

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-16 00:00:00 UTC
From: clint.bradford@woodybbs.com
Message-ID: <93.11208.7583.0NFBBA84@woodybbs.com>
Source record: 208687

Subject: Icom Batt on HTX-202

HTX-202 "ER2" indicates a PLL unlock. The radio gives this error if the PLL alignment is off or if the transmitted signal interferes with the internal PLL frequency. This error has been reported most frequently when using the supplied "rubber ducky" antenna with either a high-power battery pack or with an external DC source.

According to the internal Tandy memo, the fix for this is to use an external antenna when using external DC power. The memo goes on to say that if the problem persists, send the transciever to the repair center.

Is your unit new? If so, take it back for another.

I have read about this problem, but never experienced it first-hand with the six or so HTX-202s that I've worked with. On 12VDC from all sorts of power sources.

Setting time

1. Press MODE button
2. Press STORE button (CLOCK should now be flashing)
3. Use UP and DOWN controls or the tuning knob to adjust the time

Setting alarm

1. Press TIMER (on top of case)
2. Press STRORE (STANDBY should now be flashing)
3. Use UP and DOWN controls or the tuning knob to adjust the alarm time
(in 24 hour format)
4. Wait. As long as STANDBY appears in the LCD, the alarm is set.
5. To disable alarm, press TIMER to toggle STANDBY off.

(From the Realistic DX-440 manual - should be the same)

Yea,
That kind of article makes me want to publish the code!
Perhaps that's because I "know' the HC11. And infact have already
written code for my auto-tuner. (It used stepping motors to drive
variable caps and coils.)

But, flatly stating the code is NOT available to Hams is just waving
a red flag.

I disagree with the ARRl for publishing a "construction" article,
and allowing this kind of advertizement.

I have a friend who is looking desperately for triple curcuit
tuning coils used in old radios from the 1910-1915 era, specifically
Marconi RCA (before radio tudes were common). These coils are the
size of a regular coffee can.

My friend is willing to pay well for these. Please e-mail me
if you have ANY informaton. Thanks.

I posted a request a while back and did not hear anything then I found out that my school's news server went down just after I posted. Now I am home for Christmass break and figured I would try again.

On with the show. I am looking for any mods for my Kenwood HT. I is a TH22-AT. In particular
I would like the mod to make it possible to transmit out of band. I need it to transmit in the
150 MHz area for ski patrolling. I would also like to see all other available mods out of curiosity.

TNX.

In article <dgfDJI7B3.Ep3@netcom.com> dgf@netcom.com (David Feldman) writes:
>They (6LQ6 type tubes) are now in very short supply and are quite expensive.
>Per-tube costs range from $8 to $40 depending on type, demand and vendor.

Um, Dave, $8 was cheap for that tube in 1968 when they were plentiful.
That was about the reseller price for it.

Since you're a sweep tube fan, you should know that the 6LQ6 was a
substitute for the 6JE6. Very popular in tube-type RCA sets as the
horizontal output tube. You might find that either will work in a
linear, but the 6LQ6 will probably take more of a beating.

My TM-733a has good quality aircraft band receive but it is not terribly sensitive and the audio level is a little lower than on FM. The 733 like the TH-27 has an AM detector. Not all the radios with aircraft receive do.

My son and i recently bought a TenTec Century 21 CW rig. It's an analog display. We'd like to know exactly the frequency we're using to transmit. (It seems that the FCC wants us to know this too :)) So, someone suggested that we buy a Radio Shack pocket frequency counter for $100. What is the collective wisdom here? Is that the best idea. (Obviously, it we had a bunch more money, we'd have bought a digital rig.) Any ideas about the frequency counter idea? If so, what's a good one to get? And, what about the Radio Shack model?

Boy, do I appreciate your answer. THANKS in advance!!!

E-mail helps, but I'll also check here regularly. (Assuming that the our system does not crash.)--

Hi - I've had my 706 for about a week now. I had to wait over a month for it but it was worth it. I haven't been disappointed and would recommend it. The only regret I have is not ordering the narrow CW filter with it as it really needs it and now I have to wait until January for it as they are in short supply. Also it doesn't come with any mounting brackets for mobile use so I've had to order them as well.
Get one & enjoy!

5720. More survey of major brands repair times.

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-17 00:00:00 UTC
From: "John T. Young" <jtyoung@u.washington.edu>
Message-ID: <Pine.PTX.3.91j.951217071207.3015B-100000@carson.u.washington.edu>
Source record: 208698

A few more responses came in re: the major brands factory repair time survey. 1). re: Icom "was told radio would be repaired quickly due to my time constraints and would be done for free. Returned with a $70 UPS COD charge and nasty note from Icom about the terrible job I did soldering (what soldering?!). Stopped payment on check, sold radio, bought an Alinco."

2). Alinco: "DJ 580 with intermittent problem of memory dumping was sent back to factory six times. Never fixed. Eventually sent me a new radio after dealing with the problem for a year. Own eight Alincos but sure dread having to send anything back to them."

3).Yaesu: "sent F-51R back for 15khz update. On the phone they said it would be a max. 5 day turnaround. Just got a postcard saying it would take two weeks."

4). Kenwood: "sent 732 back due to UHF recvr probs. Took a month. My last Kenwood...switching to Yaesu."

5). The final word comes from someone who wrote: "Whether it be Icom, Kenwood, or Yaesu, the service repair time is now 5 plus weeks for non-warranty repairs. Most warranty work is done as first priority and is usually completed in less than a week."

My thanks to all who contributed to this informal survey. From my own standpoint, I am not sure that anything conclusive can be drawn from the survey! One thing for sure...hams without their gear are not a happy lot. Seems to me that there are horror stories regarding all brands and much of that may depend on how the gear was treated by the hams themselves. I should point out that out of nearly twenty responses to the survey, there was only one response from a Kenwood owner. This MAY indicate something...or maybe not. You be the judge. Good luck and may all your gear stay in tune. Best of the Holidays to you all. 73 de John, KI7JB.

5723. Yes, Kenwood is losing it

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-17 00:00:00 UTC
From: ham@w3eax.umd.edu
Message-ID: <4b1m09$rps@cville-srv.wam.umd.edu>
Source record: 208701

I have had a 520 and a 530, and a beat-up 120 for a short time.

THESE were unbelievably rugged radios.

The 430 was pretty solid, and the only 930 I have played with
is the one at the U of M's shack. It works great when it works,
but has had major failures in the past five years - three trips
into the service bay.

The 440S I was to buy from WN3K lost its display the day before
I bought it; apparently, it was a cold solder joint on one of
the surface-mount ICs. Not an uncommon thing.

The U of M's 440 failed without even being wired to anything.
It was sitting in the back seat of a car on Field Day with
all doors open (maybe 110 degrees) and wouldn't work, even
when it had cooled off. Occasional problems since.

WX3Q's TS-50S went back to California (at his expense) FOUR times
in the first four months of ownership. It kept blowing the
finals, including once after a repair had been made WHILE ON
KENWOOD's TEST BENCH at 10 watts output! Final determination:

A cold solder joint prevented the protection circuitry from
functioning properly.

Another gentleman claims that he and others have problems with
their 940s after a few years, like the un-graceful aging of
components makes them unstable.

I don't need any of these kinds of problems. I won't touch any
post-1983 Kenwood amateur gear without a REALLY good reason,
and I'd be unlikely to touch any of their consumer products
as well. Apparently, I'm not the only one who has been touched
by their soldering problems...no doubt their engineering is good,
but the execution has really stunk of late.

>WD4RAT
>kkidd@usit.net

Kevin,

ALC is a sig FROM the Amplifier TO the exciter. It is a DC voltage
relative to the output level of the amp which the exciter uses to
control it's drive level. Nice concept but I can never seem to get
ALC to work right without readjusting for each band.

500 - 600 Watts out of that amplifier is about right, The thing uses a
pair of 572B tubes and I wouldn't expect much more.

Good Luck, KN6KK Tommy

5731. Re: Fix your MFJ Mod. 986 Tuner before it breaks

Newsgroup: rec.radio.amateur.equipment

From: "Wm M. Malumphy" <aa1nl.vgernet.net>
Message-ID: <4b2lem$irg@mserv.wizvax.net>
Source record: 208625

To MFJ Buyers ,

Richards suggestion on the 986 works well.......but you might ask yourself why you would have to modify a new piece of gear this way ? The answer.... MFJ makes kits that are 75% assembled . Thats how they keep the prices down on their equipment.....by cutting labor costs . I've found that if you too view an MFJ product as a kit , you won't get nearly as mad as you might if you actually expected the piece to work the first time out of the box.

Personally, I've been snared by the glossy marketing strategy of MFJ a couple of times . So don't feel to bad about being taken to the cleaners buying an MFJ kit. In the long run your technical ability as a ham op will increase amazingly and you'll be a better person for it.

Best 73 to all es happy holidays de Bill AA1NL

To MFJ Buyers ,

Richards suggestion on the 986 works well.......but you might ask yourself why you would have to modify a new piece of gear this way ? The answer.... MFJ makes kits that are 75% assembled . Thats how they keep the prices down on their equipment.....by cutting labor costs . I've found that if you too view an MFJ product as a kit , you won't get nearly as mad as you might if you actually expected the piece to work the first time out of the box.

Personally, I've been snared by the glossy marketing strategy of MFJ a couple of times . So don't feel to bad about being taken to the cleaners buying an MFJ kit. In the long run your technical ability as a ham op will increase amazingly and you'll be a better person for it.

Hi to all,
I would like to find the low band and UHF Preselector plug ins for a Cushman CE-3.

Question: Has anybody ever found a filter that is less than 20KHz wide that will work with the 10 MHz IF in the Cushman Wide Band Mixer and the Preselectors?

Thanks,
Hadley

5735. TRAC KEYER - HELP !!

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-18 00:00:00 UTC
From: fitr%mimi@magic.itg.ti.com
Message-ID: <4b2n6e$ktq@tilde.csc.ti.com>
Source record: 208629

Seasons Greetings,

I found a TRAC electronic keyer and am trying
to get the old beast working again. It is pretty old
by todays standards, using 8 or 9 general purpose TTL
logic ic's. No model is on the case, but the board
inside says TE-001. Trac is a company located
somewhere in NY, but is out of business I'm told.
Here's the problem:

I am able to get the keyer to key, making dits and
dah's when connected to a 3 wire stereo phono plug, I
even hear the cw sidetone out of the internal speaker.
It sounds normal...no problem.

I am NOT able to get the keyer to key my modern, solid
state HF rig. When attaching the key line from the
keyer to the rig, the rig just keys up and stays keyed
as soon as I hit a single dit or dah. I even tried
bypassing the chassis mounted "jacks" and hard-wired
the key line to the rig.

I have tried everything to get this to work. In fact,
I've even run the rig with zero RF out, thinking some
stray RF was getting into the keyer and somehow
keeping the rig keyed. But still...no luck. As soon
as I hit a dit or a dah, the rig keys up and stays
keyed, even though the "keyer" is acting normal (as
determined by listening to the sidetone of the keyer)

I suspect now that either the keying transistor is
bad, or perhaps the keyer is wired for some older rig
and is unable to key a modern solid state rig
properly.

So, if anyone can offer some advice, I'd be
appreciateive. I already have the thing torn apart,
all the wiring undone for troubleshooting, and still
cant seem to get the thing going. I'd need a
schematic or parts value list since I cant tell what
the keying transistor is. (no value on it) to
replace it.

Thanks...

>I'm an aspiring ham and I'm going to start "listening in".
>I'm wondering what equipment I need to get one of my computers
>to interpret morse code ? I'm under the impression a TNC won't
>necessarily do this (though I also intend to get into packet).

I've used an AEA PK232 for a few years for packet and general SW
decoding.

The 232 does "decode" morse and automatically tracks the speed
(and it's quite strict on showing bad operating practice!) but
it is nice to hear code and watch it being decoded on screen.

Long term though, try and learn the code (I'm at about 5WPM), get
a copy of a PC morse tutor (NuMorse is good, I've had a few problems
with Supermorse) and work from there.

Good luck

Hi Jeff,

I'll save you some time and say the FT-530 can't be programmed with ADAMS Software. I have talked to the FT-530 design people and it can't easily be done and that is why no software is available. You can always get an FT-51R and program it with the ADMS-1B software.

I ran an FT-5200 in my 92 Escort GT without a bit if interference trouble. I was warned about fuel pump noise too. The pump leads on the Escort are accessable under the back seat so it would have been easy if it was necessary. I have a friend with a Kenwood 732 in a '93 F-150 - no noise or interference problems ever detected. Enough on "other Fords".

I just got a new Explorer three weeks ago. I haven't put the 5200 in yet - since I haven't figured out where to put the transciever. I would be interested in hearing from people that have installed two-ways in them. But what I want to know about is how you installed the radio itself - not what mods you made to other systems on the truck...

How did you run power? Straight to the battery? Ground to the battery as well?

What kind of antenna? Mag mount? Roof mount? (Drilled a hole? Where?) Glass mount? (Where?).

Anyone ever installed other LMR equipment in an Explorer (non-ham gear)? We have several Spectras running in company Explorers on UHF without any trouble that I am aware of.

The easiest way to mod this radio for receive only is via software.
Purchase the R.T. Systems software and modify the win.ini file.

Look for allowanyfrequency=0 in the win.ini file

change it to allowanyfrequency=1

Thats it, now you can progrm any freq from about 60-999Mhz although the
stuff above 600 doesn't seem to work the others do.

I bought the FT-1000MP about a month ago and love it. I enjoy CW work, and really appreciate the "OPTIONAL" 500Hz filters in the 1st and 2nd IFs. The EDSP performs about as well or perhaps a bit better than my DSP-59. Compared to the 1000-D, the 1000-MP has only 100W out as opposed to the 200W from the 1000-D.

The 1000-MP has a built-in 120/220V power supply, and may me operated from 12V by changing an internal jumper(PIA). If you need the dual VFO feature, your love the 1000-MP, but unless you do a lot of contesting, it is, (IMHO) an unnessary feature.

The entire radio is Meun driven, and largly reconfigurable to individual needs/preferences. As for performance, my previous rig was a FT-890, and while I was generally quite happy with it, the 1000-MP runs circles around it, particularly in the area of weak CW reception, and selectivity.

Hope these remarks help, if you have any specific questions, please feel free to drop be a line by e-mail.

Missed that question. I have a F150, F250HD, and a Mustang GT. All three were substantially improved in noise by grounding the engine block, trans, and exhaust systems at several points. I snapped the bead over the wires by the tank, and bypassed the supply leads to the chassis at the tank. I removed a tiny bit of insulation and soldered the cap leads to the wire, sprayed the new connections with plastic spray, and gooped em with RTV after the spray dried.

Pulling the fuel tanks is a job, so avoid it if you can.

By the way, be sure the antenna is connected to major sheet metal for a ground!

Be sure the cab and fenders are grounded, the F series floats on rubber.

The HTX-202 is not modifyable (sp) to cover out-of-band frequencies,
either receive OR transmit.

The HTX-212 works pretty well. The receiver isn't as tight as the
receiver in the 202, but then again, it's a wide-band receiver, and the
202's isn't.

I have an '89 Grand Am and ran into the same problem. I ended up installing my 2 meter radio in the center arm-rest console. I took the cassette rack out, and my rig just slid right in, with room left over to hold the mic. The cover closes and locks just fine. I found a biggish red wire running the length of the compartment that has +12vdc on it when the ignition is on. I tapped into that, grounded to a handy bolt, and it works great. No alternator whine, no problems. If you have a similar console, and if your radio will fit, it might work for you too. It's really quite roomy; my radio is a Yaesu FT-2500; not a particularly small radio by today's standards. Best of luck.

From: mcc@Eng.Sun.COM
Message-ID: <4b4l1v$1f@engnews2.Eng.Sun.COM>
Source record: 208652

What is the current price of TR7A? The radio I'm looking is fully loaded, all the necessary filters are included, power supply, noise blanker, etc. The radio is in mint condition. The asking price is $800. Is this a good deal?

I appreciate any info about the radio. This will be my first rig if I'll get it.

Thanks
Medy, AC6QR

5759. Re: Question: GE Master II at 52.525

I saw your responce and was wondering if the Master II exec has the same problem as the Master II with RF shielding. The recieve oscilator emits a low level singal that will get back into the exciter anc cause some interesting noise on xmitl. I the Exec is like the Master II how did you over come this problem. I am using some aluminium for shielding but still havent got all the noise out yet.

Well, it just seems to be where you are or luck or something?
I have owned lots of Kenwood HF gear, and never had serious problems,
even with Kenwood Service, who have always treated me pretty
well.

I've owned the TS 520, 530, 430, 440, 690, 940 (early serial number).
I have the 440 after about three years still on my shelf because
it has been a very solid performer, and I can't bear to let it
go. The 940 is off in a friend's shack, working away very well,
keeping our friendship going, hi hi. I swapped the 940 and an
amplifier for the Ten Tec OMNI VI, and am generally impressed
enough that Kenwoods will not be coming into my shack, but it is
not because of reliability problems.

On the other hand, I have had a reliable FT 890 from Yaesu. Never
had an Icom HF, but had horrible treatment from the factory with
reliability problems with the old IC-2AT....two of them in series,
and swore off that brand (though I realize that is an emotional
reaction, since I see many Icoms performing fine.)

I don't know what the bottom line is. I do know many who swear
at Kenwoods, rather than by them. I know far more that swear
by them, including some rather demanding sorts. I have heard more
complaints regarding Kenwood service than other stuff, and have
personal experience with a friend that leads me not to trust them
much right now. I do a lot of my own work, when it doesn't get
too complicated, I figure that is part of the fun of the hobby,
hi hi.

>There is no 18 MHz disclaimer on the AL1500. So I assume the AL1200 will
>not run at full power above 18MHz. Does this seem correct?
>
>

The Al-1200 is derated in duty cycle above 18 MHz by the capacitance of the PA tube and limitations that causes in component heating. It will certainly run over 1500 watts out on CW or SSB continiously, but not a half hour carrier without interuption for cool down of components.

The exciter drive power requirements of the 1200 are higher than the 1500, but the tube lasts longer and is much less expensive. It takes at least 100 watts to deliver 1500 watts, while the 1500 will deliver over 2000 watts at the same drive.

If you have a FT-1000 or 950, the 1200 will put out over 2kW. It is gain limited, not tube saturation or power supply limited.

> b). the suggestion to go out and buy one.

Bill,
May I suggest that you scour fleamarkets / hamfests for a low pass filter?
Price should be about 20 bucks. One that I've successfully used was made
by Drake. The model is TV-3300. The filter will easily handle 1KW and has
better than 80 db attenuation above 41 Mhz. The filter is in a very heavy
duty all-metal case. While I believe Drake no longer makes this unit, I
believe they are fairly common and should be no trouble to find. Really,
it is an excellent unit and I'd not use anything else after having tried
a few other LP filters.

Good luck and happy HF'ing.

>
>Jim W8ZR
>

There has been some traffic on this particular article on the QRP-L list. Since the
following message was sent to the list in toto, I do not think that repeating it
would violate any netiquette. The author, although not attributed in the Jan '96
QST artictle, was involved.

=Precedence: bulk
=From: Gene Tehansky <tehansky@atc.ameritel.net>
=To: Multiple recipients of list <qrp-l@lehigh.edu>
=Subject: Re: Antenna Tuner
=X-Listprocessor-Version: 6.0c -- ListProcessor by Anastasios Kotsikonas
=X-Comment: Low Power Amateur Radio Discussion
=Date: Thu, 14 Dec 1995 14:18:24 EST

=I backed away from the net for a bit and talked to my friend about the
=tuner and the article and I forgot a few things. The original submission
=of the article to QST did include a detailed flowchart of the software in
=the microprocessor. QST rejected/turned down/just didn't print this
=flowchart. I believe they felt it was not of interest to there general
=readership. Apparently they feel they would be like the computer
=magazines of old, where the readers spent hours typing in basic code for
=a program listed in the the magazine.

=Anybody interested in the flowchart can get it for a self addressed
=stamped envelope sent to the address in the article (along with a
=note explaining what you want and a return address). That reminds me of

=the story about the order for a qrp transmitter that only had a return
=address on the check. The check was cashed before that was noticed....
=What does one do then, other than wait for a second request for the
=board.....

=I regret that the article had this negative effect on some people but
=this microprocessor was the only alternative we saw to produce this
=compact device. That being decided, we needed a development system to
=program the chip. How many readers of QST have that.
=Should we have used the article with the code included to advertise a
=development system for $59.95, listen to them then, that would be
=advertising. If this type of development system was commonly available,
=and the code was provided, and somebody thought they could improve upon
=it, and they had a small bug, what then. Assembly language can not be
=tought over the phone, in email, or even in college I think. The 68hc11
=is not hard to program but unless one is fluent in the ins and outs of
=assembly language in general, this is a giant bag of worms. Both Dwayne
=and myself do not want to be short with people, we don't want to ignore
=peoples problems and we would love to be helpful, but imagine only 10
=people attempting the ultimate, improving the code, imagine the phone
=calls, imagine the anger when we couldn't or wouldn't help, that is a
=road we did not want to travel.

=I thank everyone for their kind words. Right now I feel this has been a
=positive experience.

=Sencerely
=de aa3av Gene from beautiful Mechanicsville Maryland, roadstop on the way
=to nowhere.

=OBqrp: The tuner appears to work fine at qrp levels. The problems of rf
=getting into the micro just are not there at reduced power levels. The
=most extensive mod that might be required for qrpp levels would be an
=extra wrap of the transmission line on the sensor toroid.

And I must include my own spin on this I sent this to the QRP-L....

Up here in Canada, we won't get QST until the last day or two of December or the first week in January. So I looked up the web page as Gene had posted. Impressed with what I saw, I gave the company a call on the phone. I spoke to Jennifer on the phone at LDG Electonics and she was kind enough to take the time and faxed me a copy of the article.

After I reviewed the article, the only part I really need is the microcontroller because I haven't the faintest clue on how to program these suckers. All the rest I can do myslelf. However, should I decide to buy the kit, I would probably get the complete kit mainly because parts gathering, in my experience, can be a real chore and oftentime quite costly.

Instead of raspberries, these guys at LDG should be given a pat on the back for finding a need and filling it. If you can programme these chips using your own software, more power to you. But neither I and most of the amateur fraternity are able to do so. Furthermore, only very few would even know what to do with the

source code, even if we could access it (I believe that Gene has sent a message to the QRP-L subscribers on how to get a copy.)

Good Lord... this article introduced a software solution to a problem as other articles. Two that come to mind immediately was the CMOS Keyer II and the W9GR DSP filter - yet you don't hear any bellyaching about those. I am glad that ARRL publishes any SOTA articles that solve problems - they don't do enough, in my opinion.

Therefore, speaking only for myself, Gene and LDG Electronics have no need to feel ashamed for what they have done and I hope that they will continue to design products that can be add to the capabilities of any amateur station.

If I may make a couple of suggestions.... It would be nice to see another version of this tuner that was similar in scope to the SCG-230 and Icom AH-2/AH-3 series of autotuners. However, after looking at the schematic diagram, it would appear that the number of inductors and capacitors are limited by the number of relay switching lines available from the micro-controller. I suspect that another controller would be required and, of course, another assembler programmer would be written. If such a circuit was available, then with the recent release of small HF/VHF rigs, such as the TS-50 or IC-706, a more affordable auto-tuning option would be available, using a stainless steel mobile whip.

Another simpler circuit that would be required would be a micro-controller circuit to control any of these "screw-driver" antennae that are on the market. These mobile antennae are based on Don Johnson's design called the DK3. An example of a commercial version of this antenna is the High Sierra HS3. The common way to tune these antennae is to have a reversable switch in the driving position, listening for the highest level of noise, and then tune for minimum SWR. This is not something that should be done while driving. However, a micro-controller would do this automatically by energizing the motor, sliding the coil up or down appropriately and stopping at the minimum SWR.

73 and live better digitally

Took the bait...

I found the original post kind of funny. He claims he uses his cell phone talk to a friend. Well, the duplexor in a cell phone will keep it from transmitting on the high side of the freq pair. So you can't use a cell phone to talk, point to point, to another cell phone without some real mods.

Pretty funny.

rcarpen@DGS.dgsys.COM (Robert J. Carpenter) wrote:

>ICOM says I'm the only person who has complained to them about the FM BC
>reception.

I doubt you are the only one to complain, however, I just thought I would add (from a relatively inexperienced ham's point of view) that for my listening in the Albany, New York area the radio does very nicely. There are not lots of stations effectively on top of one another (that I can tell) so that is not a problem and the quality of reception is plenty good. My wife's car has a stereo radio and mine had none. Now with the 706 I listen to my favorite staions in my car too. What a neat rig!

I wish you luck. Hopefully we'll all benefit from your findings.

5774. TS850 slope tune with CW filter

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-18 00:00:00 UTC
From: krisn3rqt@aol.com
Message-ID: <4b5ajq$rg0@newsbf02.news.aol.com>
Source record: 208768

When I added the YK-88C-1 500Hz CW filter to my TS850 the slope tune no longer behaves properly. The high cut cuts way too much and the low cut is completely ineffective.

Is this normal behavior? Is the slope tune supposed to be useful for CW when optional filters are in place?

The YK-88C-1 is for center frequency 8830KHz (1st IF). This is currently the only optional filter in the rig.

TNX.

5775. Mod for Kenwood TM-742A

5777. HF amp questions/recommendations

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-18 00:00:00 UTC
From: sherwood@oribi.cig.mot.com
Message-ID: <sherwood.819314344@oribi>
Source record: 208771

Hellow people,

I am researching HF amps (to buy one) and I have the following questions
and or comments pertaining to HF amps.

1) Why did Ten Tec discontinue the Titian? I asked them this question
and they said it was in production for over 10 years, which is a long
time for a design. This does not make sence to me because the
3cx800 twin tube amp is still very common. Any opinions? Maybe they were
not selling many and therefore it was not a profitable product anymore?

2) AES told me they do not accept Ten Tec equipment for trade in.
I asked them why and they said they were hard to get parts for.
Does this make sense to you? It does not to me.

3) The manual for the Ameritron AL1200 says: "1/2 hour continuous carrier:
1500 watts (below 18Mhz)." I called Ameritron customer service and asked
them what the spec was above 18MHz. The person on the other end seamed
confused by the questions and thought it was worded this way because the
US amps dont have 10M. Even he admitted this did not make sense because
it should go up to 21...
The manual for the AL1500 states "1/2 hour continuous carrier: 1500 watts"
There is no 18 MHz disclaimer on the AL1500. So I assume the AL1200 will
not run at full power above 18MHz. Does this seem correct?

FYI: AL1200 uses a 3cx1200a7 tube. The AL1500 uses a 3cx1500a7.

The bottom line is, what amp should I buy. Maybe a Henry......

agomez4349@aol.com (AGomez4349)

-Hey all,
- I recently learned how to scan the 800 range using my cellular phone
-from Motorola. I also learned how to transmit over the 800 range, making
-my cellular phone into a NICE duplex two-way radio. (My friend has another
-phone, and we use them to talk back and forth, in programing mode....)
-Anyways, the range for a clear transmission is fairly short, and I was
-wondering if there was a way that I could put an amplifier on my antena,
-so I could transmit with ALOT of power, and maybe receive weaker signals.
-I WILL TAKE ANY IDEAS! Please E-Mail me. THANKS.

In a word, NO.
For several reasons the first of which - it is illegal.
Second, your phone is full duplex so you would have to build
a very good set of filters on both the transmit and receive
to isolate them from each other. big bucks....
Third, amplifiers for 800MHz are expensive. I recently built
one hundred watt amplifiers for 900MHz and 1296MHz. They were
both over three hundred dollars.
Fourth, safety. High power microwave equipment is dangerous!
Unless you know EXACTLY what you are doing don't play
with high power microwave equipment.

I know this wasn't what you wanted but maybe it will
save you some grief.

Source record: 208775

In article <4b4bc0$n0t@hera.ia.net>, Jack Kovar <kovar@IA.Net> says:
>
> I just got a TM221a for my wife Jana.
>NO BOOK! How do I program the sub tones "encode". I don't think I need
the TSU-5 decoder
>
>for encode tones, do I?
>
>I know how to program in the memory channels and offsets of repeaters.
Any other info would trip my trigger.

The TM-221A has built-in tone encoding (but no standard decoder). To program the encoder, press M.IN then the TONE key. Note that the M indicator will turn on and you have 5 seconds to complete your desired action before it goes off. If it does, just press M.IN again.

The display panel will indicate a tone frequency and the tuning knob will adjust between the standard frequencies of 67.0 to 250.3 Hz. Once the desired tone is set, press any key to return to the normal display.

Good luck and 73,
=Vic=, WA4THR

Hi,

I have a Radio Shack HT-202 I use it for my Main Mobile rig. It works really good. All of the signal reports I have gotten back have been nothing but good. As far as picking one up, I would wait until they go on sale. Radio Shack constantly has sales to get rid of there warehouse stock.

Thanks

From: nomer@southwind.net
Message-ID: <A8g1wEqQFEdT083yn@southwind.net>
Source record: 208782

I have one of those Kenwood 440s that has had frequency stability problems. I had the infamous VCO 5 fix made to the radio to get rid of the "glue" around the VCO that becomes conductive with age. The radio worked for about six months, then began to put out bad-sounding signals on first the higher-frequency bands, then spreading to all of them. The problem: once again, frequency instability. So far, I've been unable to find someone who can locate the problem. I've become weary of throwing money at this rig, and recently purchased a Yaesu FT-990 and am very pleased with its performance against any of Kenwood's rigs, especially in its receiver.

The only way Kenwood could ever get me back as a customer would be if they would recall the 440 and make needed repairs at their expense. As widespread as this type of problem with the 440s has been, I think this would be only reasonable to expect.

I think there are some commercial dipoles that will fit on a 100' lot.
Alternately, you could build a dipole to fit the space and resonate it
on 80M with a loading coil in each leg. Feed it with a current balun
at the center and you're all set. :)

>The xmtr is plugged into a Radio Shack "AC line filter".
>
>Is this the same thing as a "Brute Force Filter?"

Probably not, but the "brute force filter" may not be what you need either. The problem with these is that if you have RF floating on the chassis of the transmitter, the AC filter may simply pass it through as common mode current. In addition to what Tom suggested, I would recommend choking the AC line. You can do this by wrapping the cord around a ferrite rod, or through a high-permeability toroid.

Incidentally, RS sells snap-apart toroids for this purpose. I consider them a last resort because their permeability isn't all that high and they're not large enough for more than about five or six turns. However, if the problem is limited to 40M and it's the result of RF on the AC line, a pair of these should cure it.

One other point - if you do have RF on the chassis of the rig and the toroids eliminate the RFI, this is a symptom that something is wrong with the antenna system you're using.

>radial network.

Hi Peter,

The answers to your questions depend on the purpose of the ground
system. I get the feeling from your post that this is intended to be
an RF ground, and for that, nothing you can do from a 2nd floor shack
with ground rods will really have much effect. Nor do you need an
RF ground attached to either the feedpoint or the rig with that
antenna. Use it without an RF ground and save yourself a lot of
unnecessary work.

Don't hold your breath. When I was in the audio biz, most of the major
manufacturers did this at one time or another. Pioneer, Sansui, Akai,
Yamaha, B&O, etc. etc. However, I can't remember Kenwood ever taking
care of its customers this way despite the same rate of poor designs
or defective components. On the other hand, there are worse audio
companies than Kenwood. Good thing they don't make ham gear. :)

Message-ID: <DJtppD.841@lila.com>
Source record: 208557

I'm in the market for a compact (handheld would be ideal) SSB/CW HF radio and was wondering if anyone has any experience with the "Pico SSB/CW Tranceivers" sold by jCom. They are single-band SSB/CW QRP (2 watts) tranceivers in a full-size handheld package. I came across and ad for these radios in an old issue of _73 Amateur Radio Today_ (1993) but have been unable to contact jCom and fear they may have gone out of business. I believe the radios are manufactured by a Japanese company and hope that someone may be able to refer me to another source. Alternatively, if anyone would like to recommend something similar, I'd be interested in hearing it.

Source record: 208566

I own the Alinco DX-70T. It performs well on SSB, haven't tried it on CW. I use it strictly mobile. I'm impressed with the receive audio, sounds good even through the little speaker on the radio's top panel. The operation of band changing is not as straight-forward as I'd like, but since I have to stop the truck to change antenna band taps (Outbacker Perth), it's not a big deal to change bands (not a big deal anyway, you just have to be looking at what you're doing due to multi function knobs). Being able to remote the front panel is nice, but costs extra. The radio has a good solid feel to it, as if it's constructed well. I know my Alinco handy-talky is well built also.

Overall, I'd say it's a good buy for the price.

Make sure that the channel element is oscillating. Watch out that you don't fry the 15 w driver transistors (the solid-state output that drives the cavity amp), those transistors are particularly hard to replace.

There is a helical resonator filter between the driver and the PA. This must be re-tuned to get the sucker into the ham band. This is where the jumper between the driver and PA is attached to the Motrac chassis. I think that it is stamped or marked that it is not to be retuned except at the factory; I retuned a couple of these with no problem. You will need a spectrum analyzer and tracking generator to do this most easily, otherwise you could do it with a walkie and a wattmeter, but I don't recommend that method.

Let me know if this helps.

To Every ham:

Exciting news, I found one company that carry battary at very low price. Kenwoord, Icom, Yaesu, Motorola. The company is MAHA COMMUNICATION. They are also looking for regional dealer. Contact them at 8183334497 in LA,CA. (They don't like a single quantity order, combine your club order for a special price, *Shipping free for club!). They also got TS (Taiwan Serene) Antenna, and ADI Radio!

A friend who used to be an engineer with a bio-instramentation(spelling),
suggested adding a ground plane. The lab he worked in, had all of the
workbenches covered with a sheet of copper and a vinyl/rubber sheet over

that. I could not afford, or even find, a sheet of copper 3'*6', so I used a sheet of galvonized steel. I tied that sheet to a ground ring with a doubled piece of 1/2" braid. I have painted the sheet metal with a thick vinyl paint, and tie all of my radios and junk to it. I tied case of the pc and the ground lead of the monitor to the ground plane. Except for the birdie from my MFJ1278(at 4.52?MHZ), it is pretty quite. The trick, I think, is to not have several ground paths so that you make a bunch of ground loops.
It is a cheap easy and easy to try.
Oh yea, put lots of torriods on all of you power lines, after you pull the ground lines out. I even went to to degree of running everything, but the pc/monitor, from dc. I used 1/2" braid as the negative/ground lead, and put torriods with several turns in all of the +12volt lines.
It worked for me. Good luck.

I don't think the 530 can use the ADMS software. As for what's in the box, there is a Maxim chip in the connector shell (one of those RS232 <-> TTL level chips) and about 2 tiny capacitors. That's it.

>(ie. Good Luck!) The guy gave no indication that Yaesu would do this
>for you for any price.

>Let me know if you find a different answer.

>John, KB0UNC

Yep! That's the symptom. A friend is using the FT-11R, and it works great except for the transmitted PL is extremely loud. I haven't put a deviation meter on it yet, but I'd guess nearly 1KHz deviation. I haven't looked at the schematics yet, but if the fix involves changing a resistor, I'll have to avoid coffee for a week to get steady enough to change those babies.

Oddly enough, I've got the FT-51R (same series, only dual band), and its PL deviation seems to be perfect out of the box. Some of the functions (including microphone level) on my FT-51R are adjustable from the keypad in the diagnostic/service mode, but I'm not sure about the PL.

>Stefan, G0BJW
>CompuServe 100627,3426

I did the expanded freq mod found at http://www.qrz.com, and it works fine.
One solder jumper to remove, and it covers

110-140 RX
140-174 TX/RX
174-180 RX
420-470 TX/RX

There may be more coverage, but I haven't poked too much at the keyboard
yet. It seems to auto select AM mode in the 110-140 band, and can be
forced to AM or FM anywhere. Of course, the AM/FM mode selection can be
stored in a memory along with the frequency.

I don't think it covers to 70MHz, but there may be more mods to come.

Good luck, and let me know of you find other mods.

From: aust@gandalf.sp.TRw.COM
Message-ID: <9512192349.AA03884@frodo>
Source record: 208578

About 1.5 months ago I picked up an Icom IC-706 HF Rig
and have been watching the newsgroup about this newest
HF rig.
I have been told that sales for this rig has really taken
off and that all other manufacturers of HF gear have felt
the bite of this little rig in the maket place.
At present, the ratio of IC-706 sales to other HF rigs have
been greater than 4 to one. What a way to take over the market,
by getting a bigger share of the marketplace.
I have had 7 hams come over to my QTH, to see it, since, it was
hard to find one on DISPLAY in the stores. Now 5 out of 7 ran to the
nearest dealer to get one!!
Hopefully, Santa can put one under your tree for the Holidays.
I really happy with mine, previously I have had TS-50, IC751A,
still have my FT900.
Being a Communication Equipment Electronics Engineer, I really
appreciate the great efforts that went into the IC-706. After I got
the schematics, block diagrams from Icom, spending many hours, playing
with it and its internal structure, I knew this was a real winner for
the Icom folks!!!
Happy Holidays to all, especially all those lucky enough to have
the IC-706, the greatest little marvel out of Icom. If you could read
between the lines, you would know even more about the IC-706, and how the
majority of people like the IC-706, after using one. How that for an
endorsedment.

I had a 940S for five years with no problems. One day the power output dropped to zero. Ham Radio Outlet charged me $600 to repair. They turned it on and it worked for about 10 minutes and blew up again. I called in my insurance company and got $2100 for the radio; I donated the radio. I bought an FT1000 and it's been a good radio for the last 5 years. I'm keeping my fingers crossed.

Do you have another receiver that has an accurate frequency readout? You can always use that. Or, you can just ask someone on the air to tell you what freq. they're receiving you on. By making a chart showing the dial indication vs the reported frequency, you'll soon have the entire band calibrated.

>Regards...Hugh Duff VA3TO

While we do consider these factors as part of our article-acceptance
process, it is not cast in stone. We have chosen to publish a few worthy
articles for which source code was not provided.

Unfortunately, more and more projects are going to involve
microprocessors and/or software. If ARRL takes the position that we will
only publish projects for which the source for all software and ICs is
fully disclosed, we will find more and more projects that we cannot
publish. In reality, many ICs have internal "firmware" of a sort, found
in the masking used for manufacture or in gate-array type devices. Where
should we draw the line?

What *should* we do about the offer to publish a project that is
interesting, useful and affordable, if the author uses a programmed chip
that he supplies? I suspect that 99% of the people who build it will do
just what I am going to do -- order the full kit and be happy I don't
have to locate all the parts. I have to wonder how many of the folks who
are saying that we should not have accepted the article would build the
projet had the author supplied the source code. There may be a few, but
is it really the right thing to do to turn down the article that a few

folks will not build, thus depriving a larger number of people who would choose to build it from the kit?

Even more important here, the author has agreed to supply either a kit, a bare pc board or *only* the preprogrammed IC. His charge for the IC is $20.00 for a programmed part and socket. The latest Newark catalog lists the unprogrammed device for $15.23; I didn't take the time to look up the socket, but I bet it is at least a few bucks more.

IMHO, when I evaluate all the factors, I am glad we chose to publish the article. I do NOT want to see QST start publishing only kit projects that contain proprietary information (for what MY opinion is worth), however, I do believe that we should continue to evaluate these things on a case-by-case basis. In this case, when I consider all the facts and the overall availability of the components, I believe we made the right choice.

If the 530 could be supported by the ADMS kit, you can bet Yaesu would
market it for that purpose.

The ADMS box does have a few discrete components in it as well as a
small DIP, which looks to be a world modem RS232 to TTL converter, but
I could be wrong, and I havn't had the time to probe any further.

Plugging stereo headphones into the FT11 or 51 yields an odd fast
pulsing noise, which is the electronic pulse used for cloninging and
MH29 control.

An odd note on the MH29 Mic. It too, has a "casino" mode. This can
be accessed by turning the radio off and then turning it back on by
pressing the power and call button on the mic at the same time. This
reaveals that the display is capable of showing a lot more than it
really does.

Also, the INI file for the ADMS unit shows some promise for some
software mods for the FT51R, but I have yet to try that out.

>
Dean:

Boy are you in for a treat. I was a bit skeptical about upgrading the 850 after reading some lukewarm notes on this forum several months ago. I decided, however, it was worth a try. I'm very happy with the radio, although I'm a rank beginner at it so far.

Here's what I've noticed so far:

1. If you're a CW operator, the CW band-pass characteristics with the digital filtering is awesome: down to a resolution of 50hz! (Really.) This allows you to separate some very close signals completely out of your pass band.

2. If you're a computer user, you'll spend hours playing with the RCP program. It's a hobby of its own, designing virtual radios with the interface of your choice. The RCP software has an excellent scripting language (which I have yet to use) and a selection of pre-fabbed radios to suite your fancy.

3. RCP can directly key your (CW) transmitter by reading typed text, line by line, or by an entire file.

4. Without any additional hardware, you can finally set your SSB audio characteristics to fancy DX, rag-chew or inbetween frequency response characteristics. I plan on using a very bassy equalization (without processing) on 40/80 meters. On 10-20 meters during DXing and contesting, I plan to use the transmit hi-boost equalization and speech processor high frequency response characteristics. These "parameters" are very easy to change, store and retrieve via the RCP interface or the menu on the rig.

5. I'm not an expert on the noise reduction modes (as indicated by my original post to this group!) but the advertisements in QST seem to

indicate that Len Enhancer Method processing is good for SSB and SPAC for CW work.

6. This receiver has an even quieter sound than the 850, which I find incredible in itself.

7. If you're a die-hard CW operator, set the rise/fall time parameters as fast as possible. This separates high speed CW characters more effectively. At moderate CW speeds (say 10 - 20 wpm), I actually like a slower rise/fall time.

8. If possible, take delivery of this radio when you have *lots* of time to play, i.e. more than two hours (like I did). Although you can literally be up and running in 5 minutes, you'll miss out.

This is one radio that can be enjoyed best by browsing the manual thoroughly first. Keep the manual handy when you're playing with the radio.

9. The RIT/XIT knob upon first inspection appears to be a flimsy, cheap oversite because it "feels" cheap. This is actually a well thought out feature; the knob spins like a top...it makes changing RIT/XIT frequency much easier than on the 850 and other previous radios.

10. No, it's not your imagination, but the MIC GAIN has absolutely no affect on your audio signal during transmission when the processor is on. The two visible controls on your radio that do affect audio are the processor compression and carrier control. This is clearly explained in the manual. (Also TX equalization button)

11. CW sidetown volume is now controlled by your MONI adjustment. If this knob is counter-clockwise you'll wonder why there's no sidetone (This is very different from the 850!)

I don't know if he's on the internet, but my contact with Tom, WA0X pushed me over the edge into purchasing the 870. He's the first (and only one so far) station I've actually heard using the 870.

Dean, I think you'll be very pleased with the 870 as an upgrade to the 850. I hope to get some serious radio time this upcoming weekend and over the christmas holiday season. If you'd like, please tell me what HF bands you operate and I'll be glad to try meeting up with you.

Happy holidays and good luck with your upcoming purchase.

> -Thanks VE6IMH

The HTX-202 cannot be made to work outside the 2m amateur band.
The front end has sharp helical resonators, which is why the
HT has such good resistance to intermod and pager transmitters.
This is both a blessing and a curse...

I am not at all surprised that there was a response. I presume that it was mostly negative. Why am I not surprised? These mostly negative comments should be considered with the same sensitively as the news of a preacher caught "in flagrante delecto" - with mild amusement of such hypocracy. The outrage spewed out from those who object to such articles is quite evident. Yet, we never see any improvements by these same sentinels of the traditions of hamdom. Indeed, the only improvements that I have ever seen are from the originating authors themselves, the W9GR DSP filter is a singular example.

Source record: 208587

One of the finest "Sweep" tubes for ssb amplification is the 6HF5. Hallicrafters and Swan both
put this tube to good use in the late 1960's. Hallicrafters used a single 6HF5 in the HT-46 and
achieved an honest, linear, 175w PEP output. Operating conditions used a d.c. negative grid bias set for 40ma @ 725 volts on the plate idling and 210 v on the screen.

Swan used a pair of 6HF5's in the 500C and achieved an honest, linear 350w PEP output with a dc
bias at idle of only 20 ma for each tube (40 ma total) at 900 plate volts and 250 screen volts.

The 6HF5 has multiple r.f. grounding connections for the screen and cathode, which allow stable
design at very high gain levels. These tubes make use of the fact that the average powerlevel
in the human voice is 10 or more db below the peaks. Their high perveance design means that they do not work very hard at all in amateur SSB application, and will last almost indefinitely, if they are not destroyed by careless tuning. On a voice peak they may have an
instantaneous plate current of 250 ma per tube. That amounts to an input of 10X the plate dissipation,

Historic application of 807 and 6146 vacuum tubes in amateur equipment usually set dc input power at 3X the plate dissipation level, but this was based on approximately 70% class C efficiency, not the linear AB modes or the 10-20 db variation between peak and average drive
levels.

Learning by doing, not learning by copying. Most construction articles
don't meet that requirement, with or without source code. That's what
technical articles and engineering papers are for.

>A secondary concern is the inability to repair a failed unit except by
>dependency on the author's enterprise.

Most hams I've met can't even repair their own microphone. Besides,
everyone who buys a new transceiver is immediately dependent on the
manufacturer to make repairs. Why should QST be the only source
required to provide a complete and intimate knowledge of their
"product"? Call Icom or Yaesu sometime and see if you can get
their source code.

My transmitter is causing TVi on 40m and I'm pretty sure it's due
to interference on the AC line (same TVI on two different antennas.)

The xmtr is plugged into a Radio Shack "AC line filter".

Is this the same thing as a "Brute Force Filter?"

Hi Ed,

Thanks for your thoughtful response to my initial posting, and also to all the other guys who have commented on this issue.I can understand your point of view, since you don't want to deny the QST readership articles about novel projects, and since the vast majority of builders would probably opt to buy the kit of parts, even if the source code were provided. However, I think there is a matter of principle which I and many QST readers think is important, and which the publication of this article seems to violate -- namely the idea that construction articles from the League's official journal should not appear to be crassly commercial. I have received many email messages about my original posting, and several hams have commented that the ARRL "obviously" receives kickbacks from kit vendors by publishing articles of this sort. Others have said, in effect, "The whole society is corrupt so why should you expect the ARRL to be any different?"
I am not so cynical, but I think QST is beginning to wade in treacherous waters by moving in this direction, and that the League runs the risk of eroding the integrity which it has built up over the decades. I also don't think the line is quite as unclear as you claim. To my mind the guiding principle should be this: QST construction articles should not obligate the builder to buy proprietary parts sold only by the article's author. Period. If authors aren't willing to abide by the rule, then they should pay for advertising space in the magazine like everybody else.
I also think a great deal of educational opportunity is lost by not making source codes available, either on request or on a BBS. I would be very interested, for instance, in seeing the source code for the antenna tuner, not so much because I want to build one but because I would like to learn about some of the concepts. Were I to build the tuner, I might also want to "tweak" the code, perhaps changing some of the swr limits, or modifying the interface a bit. The essence of the homebrew spirit is to fiddle with circuits, and QST should not deny its readership such opportunities.
The ironic thing about this antenna tuner is that the source code seems to be quite simple. The code just switches relays in a systematic manner to find the minimum swr. There may

be some cute algorithms needed to compress the code into a small ROM space, but I doubt it. I
don't see that the authors are gaining much-- if any--proprietary advantage over potential competitors that isn't vastly overshadowed by the benefit of having their invention distributed
free to a national audience.
I would like to respectfully suggest that the editors take up this issue as a policy matter and try to develop editorial standards which can be clearly and unambiguously explained
to the League membership.

Source record: 208596

Hi:
I live in Tokyo, where it is impossible to establish a ground radial system.
I bought a Cushcraft R-7 since it supposedly does not need any radial network.
The R-7 is mounted to a mast. The bottom end of he mast is burried about
3 feet in to the ground, and the mast is fixed to the side of the house. The
antenna is a about 19 feet off the ground, the R-7's short radials
are just clearing the second story gutter. For establishing a grounding system, I have
placed four grounding rods around the base of antenna, and all of the rods have separate
14 gauge braid leads running up to the second floor, but they are not yet connected to the
antenna, mast nor radio.
I would like to know how to go about grounding the radio/antenna system. The radio
is located on the second floor. SHould the mast be grounded, and then should a ground
wired be attached to the top of the mast near the antenna and then from there
should a ground wire run to the radio. Or, should a separate ground wire be run
straight from the radio directly to a separate ground rod. What I am worried about is
possibly creating a ground loop, so should the grounding arrangement be "star" or a bus ?

Confused ?

Dean, I talked to Alinco about the noise blanker, they said that the early versions did have a problem and that they will fix it for free if you send the radio in. The said that they have a new fix for the Nov. 95 shipments. (read the QST Dec. evaluation).

I do plan to use the radio for mobil. Thanks for the input on your experience with the dx 70.

Does anyone know if there is an external VOX that would work on the dx 70???? Alinco had know idea how to do it.

> interference relateed to the 706 on 40-10 meters?

Have had an IC-706 for just a week, but no visible RFI on the PC terminal sitting right next to it (1 inch away) with antenna Coax running within 18 inches of PC stack.... a little rippling when on 80 meters, but same effect for Kenwood running at exact same frequencies

Also, no visible TVI on 1974 Panasonic TV sitting six feet away.... not even that good from the Kenwood 940 also in the shack... there's a little stray RF from the 940, but not a problem 30 feet away

My guess is that something that was right (coax, ground, maybe power supply) got messed up when you installed the 706.

Having fun with the 706... hope you find your gremlin

I'm not sure what problems with Alinco you're referring to, but I'm quite happy with mine. I own (or use) many different radios. As far as HTs go, they include the following:

Icom IC-U16, Icom IC-02AT, Alinco DJ-580T, Motorola Systems Saber VHF, and a Motorola GP-300 UHF. I don't own the Motorola's, they're work-radios.

The 02AT sits on my desk as a base radio with a power supply, external speaker & mic, and base antenna. It has given no problems, but is EXTREMELY limited on features (no scan channel lockout, PL limitations, no Rx PL, etc). It works, and I keep it as a simple radio to work local repeaters.

The U16 is used for some volunteer work, and has proved reliable.

The Alinco gets carried daily to school, to work, basically everywhere. I have repaired the BNC antenna connector a few times, but that has died down now that I don't switch antennas as often (when I first became a ham, it was my base radio and mobile, so antenna swaps were frequent). The radio is durable as far as modern ham gear goes, and I'd buy another one if it ever died. It's inexpensive, easy to use, and reliable.

When it came time to buy a mobile, I opted away from Alinco, going for something with mroe bells and whistles. I bought an Icom IC-2700H, and it's the biggest piece of crap I've ever used. It's made three trips for warranty repairs, and never did get fixed properly. I decided to fix the problem myself, bought a service manual, and spent my time doing a repair that I "paid" for with an expensive radio. The radio suffers from terrible intermod, has a crossband repeat that is so noisy it's unusable, and I think the construction of the control head (specifically attachment of PC boards from knobs to display board) is terrible. Bad design, cheap, unreliable.

If I had _that_ one to do over again, I'd have bought an Alinco DR-610T. I have two friends with older Alinco mobiles (DR-590 series), and they work flawlessly.

Friends with Kenwood have more problems than I with my Icom. The DTMF control of the radio is hideous (mic is always hot, PTT switches transmitter), making it possible to hear DTMF signals over the speaker and have them control your radio unintentionally (a friend has this problem when using an autopatch which retransmits the digits over the air after dialing). Terrible design.

I'm not sure why I'm ranting, I'm not a rabid fan of Alinco, they've made some design errors in my opinion as well, but I think they're the best

one going at the moment (save buying Motorola Syntor X 9000's, which are a pain to use due to the computer programming if you travel much). What really surprises me is the reviews in QST, which makes these radios look like they're the best thing since sliced bread. Where are they testing these radios? In a faraday cage where no paging transmitters exist?!?! Or is this what I am to expect when I read a review on one page and a huge Icom ad on the next?

Source record: 208785

Being the proud owner of a new Kenwood 870S, I'm interested in advise from anyone who's used this radio for several weeks or more. Here's a list of questions I've formed after about 4 hours of "playing":

1. Under what circumstances does the SPAC filtering work best?

2. Under what circumstances does Line Enhancement mode work best?

3. Has anyone figured out how to use the Radio Control Program to send CW a character at a time, instantly, as text is typed?

4. Is it normal to hear some "carrier" tone during SSB peaks when the IF notch is engaged and filtering out a strong signal (at about 1000hz)? What's the best way to minimize this effect?

5. Based upon monitoring my own signal, it appears that the TX-shift feature changes the frequency response of my output. Is it doing anything else?

After several sessions with this radio, I've concluded that it is indeed a worthy successor over my 850S-AT, which I used for four years!

Thanks to anyone who can help. If anyone needs more information on the 870, I hope to be able to help you better in the next few weeks!

If you are looking for higher data rates then you will need to sit tight and wait for the new PCS rollouts and you will see some 2 Ghz + spread spectrum equipment that will handle the higher data rates. Microwave is currently very expensive for the necessary radios. Even at 900 Mhz you are talking about some very expensive equipment!

5856. FT-1000D Noise Blanker

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-19 00:00:00 UTC
From: jhill@minn.net
Message-ID: <4b5dq2$h1u@bronto.minn.net>
Source record: 208791

I recently upgraded to an FT-1000D after my much loved and highly tweaked TS-930 took a lightning hit. I have been satisfied with the FT-1000D despite it not having the IRCI filters my 930 had but the noise blanker seems to not function nearly as well as I expected. My 930 would nearly eliminate an S-7 line noise problem, though like many rigs it was succeptable to overload by strong adjacent signals. On the other hand, the FT-1000D barely drops the line noise by half an S unit. It doesn't matter whether I use the wide or narrow noise blanker mode. Anyone else care to comment on their FT-1000D's noise blanker performance? Thanks in advance.

Hi Mike & the group,

I have the FT-900AT in my Raider mounted on the dashboard. It takes up very little space and is an excellent radio. I use the SG-230 tuner and their antenna mounted on the roof. This combination is top notch!

Good luck,
Jim, N7TTO/4 Mobile!

I have had my 2350 since October, and I love it. I paid $495 for it, and it was a great buy. The radio is simple to operate, and it performs well on 2m and 440. The aircraft band rx in mine doesn't work as well as I would like, but I didn't buy it for that reason anyway. It seems to have a problem with strong signals on aircraft band rx. Weaker signals are fine. It has 35w on 440, and 50w on 2m. I has 50 memories for each band, and has a built in antenna duplexer. Other operators have told me that it has good clean audio. I haven't had it long enough to tell you about durability, etc. I have only been on the radio for about 2 years, so I haven't had a lot of radios to compare it with. At this point, I would recommend it to anybody who can't afford $700 for a dual band mobile, but still wants most of the bells and whistles. It can crossband repeat, scan, and dual rx.

A couple things that it lacks. Tone squelch as standard equipment and vhf+vhf, uhf+uhf rx. I can live without either of these, and I can always buy the tone decode board if I operate in areas with a lot of intermod. I hope this helps.

As I recall from a magazine review on the TS-850S, they felt like the high cut worked with one filter, and the low cut worked with the other. Based on that information (feeling?) I think you're seeing what they saw.

I have all the filters in my 850, which I put in right from the start, so I don't notice that problem.

I think the best solution is to load up with filters! ;)

I just replaced a FT101 with a IC706 and have become public enemy number 1. The 706 is wiping out cable TV, telephone, AM/FM radio, and most unforgivably, my son's Nintendo. Operation with the FT101 produced mild telephone interference only. Has anyone else seen such severe interference relateed to the 706 on 40-10 meters?

From another Dean...

I use my DX70 mobile AND in the shack. It doesn't compare to badly
with my 990 but will take the 990 for shack use in general. As to
mobile, the 70T is miles ahead of my old 757GX. Only knock is the
noize blanker? It doesn't.

Listen for me tomorrow on 14200 +/- on a short trip into the
mountains of Az.

Hi Mike,

I'm using the Alinco DX-70 as a travel rig. I've been all over the place with it and am very pleased so far. I dont use it mobile....I use it as a suitcase 100 watt HF rig while traveling around SE Asia. Works fine, great audio. Have a FT-890 too, but that rig is too heavy to lug around. Guess it depends on your usage. In the mobile, the 890 is nice since it has the built in keyer and ATU. Then again, the DX-70 is about 1/3 the weight but omits the internal ATU and CW keyer.

>report so far. Anybody who has same problem? HL1DK/Lee

Several months ago, there were similar reports on this newsgroup
that the FT-900 had a CPU problem that caused the rig to shut
off mysteriously after a few minutes of operation. I dont recall
the specifics, but a firmware upgrade was required to fix the
problem.

I recall the 900 in question was being used as a repeater remote base,
and the periodic shutdown was very troublesome for the owner since he
was forced to return to the repeater site to cycle the rig off/on again.

Perhaps someone can offer more specifics that I.

Best regards and seasons greetings,

Joe BV/N0IAT

Taipei TAIWAN

ex 7J1AOF ex KA0ZDH ex YU3/N0IAT
Licensed Radio Amateur since 1986

The USA station that Joe referred to is NI6R in Brea,California. USA, he
took his FT-900 down to Yaesu USA, according to him, they shipped his radio
japan to fix it.
He has a company that builds HF remote control cumputer interfaces
for HF radio's.
That's how I learned of it, and I contacted the Technical Representive
named (Chip) at Yaesu USA in Cerritos, California.USA and he said bring it
in, we will upgrade to version 3, under warranty, for free , since then,

no problems, great RIG.
73
Mike
WB6DJI

Also, my brother hasa FT-900, WB6ZUF, had the same problem , he took his in,
had the firmware upgrade, had it replaced at the Yaesu USA headquarters in
Cerritos, California. USA.
The people in Japan may not be aware, since Yaesu USA took the lead here,
to fix the problem, by upgrading the radio's in the USA, and Japan just
upgraded the CPU firware, with thinking that the Main Field Offices like
Yaesu USA, Yaesu Europe would do the CPU firmware changes in their facilities.
I believe there is a communications problem there on you end, I suggest you
have Yaesu Japan contact Yaesu USA.
Now, its a great rig!
Yaesu Corporation USA did not want to get a bad image here, so they really went out of
their way to keep their customers happy.

I haven't seen one but the specs look good for the QRO PA. It is likely make from a group that split off from Commander since the design both external and internal is very similar. If you look at $/Pound the QRO is good value. This indicates good power supply and heavy mechanical design. It also has designations on the front for all bands.

: Dean Hemphill, KC5NG

I have a 570T, one of the later ones with the X-band repeat switch on the top.
The only problems I have are:
1. Front panel buttons don't work if it's below freezing, but this goes away
after I have the radio on for a few minutes, so I really don't consider this
a problem.
2. The 2m oscillator had a bad solder joint inside, but the radio had been
in a collision that spun my truck about 270 degrees and gave me a helluva
backache. I reheated a few connections and the problem evaporated.

My friend has a Kenwood dual band, a 731 I think. His UHF continually cuts
out like the SWR is too high, even into a 500MHz rated dummy load. We cleaned
the solder flux residue (due to poor assembly at the factory) from the UHF
out traces, which reduced but did not eliminate the problem. I was aghast at
the poor cleaning of the finished circuit boards, there was flux everywhere.

An Icom rep I talked to said that "a synthesized radio can be made to go pretty much anywhere it can lock" <- minor addlib on my part but that is the idea... you should be able to find a mod somewhere. Try to goto ftp://oak.oakland.edu/pub/hamradio/mods/icom or the equivilent.

The 706 will monitor 27.065 fine as is, if you are talking about making it into a legal CB transmitter, I don't see any way.

I've had a lot of fun trying to keep my SB-102 on the air, but this time I'm stumped. Any SB-102 users out there willing to help would be very much appreciated. Problem seems simple:

Rig operates great on 80 & 40 meters; Mic/CW (Drive) control works per design. On other bands, Mic/CW control has no effect, always high, and seems to have carrier output (even in SSB modes). There seems to be some modulation on the carrier, like AM. I can imagine what could cause this... but NOT just on these bands and not 80/40!!! I've stared at the schem on the bandswitch, and sure enough, there are things going on for 20 mtr & up that aren't for 40 or 80, but they seem just to be final tuning caps and such.. nothing I can grok that would cause this. Guess its just beyond me, I'm ashamed to say. Sulk.

Anybody squared off with this before?

Well, I guess I cannot claim to be an experienced ham, given
I've only been in the hobby about three years.

My Alinco DJ580T dual-band HT has been an excellent performer.
It's a wideband HT so yes, it does experience intermod problems
in certain areas of the city. That's to be expected with ANY wide-
band rig. I have used by DJ580T daily for almost three years now.

You mentioned Kenwood. I once bought a TH22 2-meter HT.
So much intermod I returned it to AES 2 hours after I bought it.

I also had an Azden AZ-21A 2-meter HT. It looked tough
as nails. It went back to the factory three times before they
finally got it right.

I have an Alinco DR600T dual-band mobile. It has some
software glitches when in remote control mode. However, when
in non-remote control mode, it is a flawless and solid performer.
I once ran it in cross-band repeat in a hot car with the windows up
during a 90+ degree day. It went all day without a hiccup. Solid rig.

I suspect all manufacturers turn out a lemon once in a while.
I don't believe Alinco is any worse than the others.

5884. Yaesu rotor problem

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-20 00:00:00 UTC
From: jdy18@aol.com
Message-ID: <4ba6oh$p8e@newsbf02.news.aol.com>
Source record: 208369

I'm using a Yaesu G-800S rotor. This was purchased new in fall 1994 and put into service this past June. When the weather started to get cold, I noticed that there was a delay of up to 10-15 seconds before the rotor started to turn. I checked with Yeasu on this. Their answer was that the original grease used in the rotor tends to dry up. When this happens it gets stiff in cold weather and the rotor won't turn until the grease warms up. They suggest replacing the original grease with Lubriplate low-temp multi-purpose grease. The antenna is mounted on a tripod on the roof of the house and is not easy to get to. Also, the rotor is factory lubricated and weather-sealed. I have a feeling that disassembling it is not a job for an amatuer (no pun intended). I'm disappointed that Yaseu didn't use the low-temp grease orginally, since they say the rotor is intended for all-weather operation. I'm also wondering if anyone else has had this problem and what, if anything, they have done about it.

5887. SG-2000 AM filter BYPASS modification

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-20 00:00:00 UTC
From: zielke@fozzie.muppets
Message-ID: <ZIELKE.95Dec20140153@fozzie.muppets>
Source record: 208372

Several people have asked me how to remove the AM filter on the SG-2000 to allow AM broadcast band reception. I have sent instructions from memory but here are the instructions which I got from SGC (I just called SGC and recieved their blessing [thanks Terry] to put this on the internet as it is copyrighted material).

SGC SG-2000

To Bypass AM Filter in SG-2000

1. Remove top cover by removing 6 each 6-32 Black Phillips head screws which secure cover to the SG-2000

2. Place radio with exciter PCB up.

3. There is a long "L" shaped metal heatsink bracket located on the left side of the exciter. On this bracket is the AM Filter PCB.

4. On the AM filter board, disconnect the gray coax from RF in jack and disconnect the short coax on the AM filter into J101. Tape up short coax connector or remove AM filter board entirely.

5. Connect the long coax directly into J101.

6. Replace the top cover and secure with 6 Phillips head screws.

This concludes the bypass procedure for the AM filter. Your SG-2000 HF SSB should now receive down to 500 KHz.

If further assistance is required, please contact SGC.

I usually don't followup to posts but sweeping generalizations demand a response.

I've owned an Alinco ALR-22 2m mobile for about 7 or 8 years. The chassis is a cast heatsink. It is well built and just keeps working. It was bought in Japan and was DOA when I got it back here. The folks at Alinco USA were most helpful even though it wasn't a US model yet. Once fixed it has been very reliable. BTW it became DOA after the dealer in Japan moded it for the US band segments.

I own a TS-940, a IC-706, and a FT-736R so I don't think that I am prejudiced.

I think there are some commercial dipoles that will fit on a 100' lot.
Alternately, you could build a dipole to fit the space and resonate it
on 80M with a loading coil in each leg. Feed it with a current balun
at the center and you're all set. :)

>The xmtr is plugged into a Radio Shack "AC line filter".
>
>Is this the same thing as a "Brute Force Filter?"

Probably not, but the "brute force filter" may not be what you need
either. The problem with these is that if you have RF floating on
the chassis of the transmitter, the AC filter may simply pass it
through as common mode current. In addition to what Tom suggested,
I would recommend choking the AC line. You can do this by wrapping
the cord around a ferrite rod, or through a high-permeability toroid.

Incidentally, RS sells snap-apart toroids for this purpose. I
consider them a last resort because their permeability isn't all that
high and they're not large enough for more than about five or six
turns. However, if the problem is limited to 40M and it's the result
of RF on the AC line, a pair of these should cure it.

One other point - if you do have RF on the chassis of the rig and
the toroids eliminate the RFI, this is a symptom that something is
wrong with the antenna system you're using.

From: Peter Shintani <shintani@tv.sony.co.jp>
Subject: Advice on R-7 and grounding(2nd floor shack)

Hi:
I live in Tokyo, where it is impossible to establish a ground radial system.
I bought a Cushcraft R-7 since it supposedly does not need any radial network.
The R-7 is mounted to a mast. The bottom end of he mast is burried about
3 feet in to the ground, and the mast is fixed to the side of the house. The
antenna is a about 19 feet off the ground, the R-7's short radials
are just clearing the second story gutter. For establishing a grounding
system, I have
placed four grounding rods around the base of antenna, and all of the rods
have separate
14 gauge braid leads running up to the second floor, but they are not yet
connected to the
antenna, mast nor radio.
I would like to know how to go about grounding the radio/antenna system.
The radio
is located on the second floor. SHould the mast be grounded, and then
should a ground
wired be attached to the top of the mast near the antenna and then from there
should a ground wire run to the radio. Or, should a separate ground wire be
run
straight from the radio directly to a separate ground rod. What I am worried
about is
possibly creating a ground loop, so should the grounding arrangement be
"star" or a bus ?

Confused ?

Hi Peter,

The answers to your questions depend on the purpose of the ground
system. I get the feeling from your post that this is intended to be
an RF ground, and for that, nothing you can do from a 2nd floor shack
with ground rods will really have much effect. Nor do you need an
RF ground attached to either the feedpoint or the rig with that
antenna. Use it without an RF ground and save yourself a lot of

unnecessary work.

Subject: Do DSP's really help?

I did some basic investigation into the fesibility of using a DSP with my old
FT-101E. After
talking to numerous folk regarding the effectiveness and cost comparison, I
decided to upgrade the
radio, rather than dump a lot of money into an audio filter, which is
basically what these devices
amount to. If you have a rig with a crummy IF stage, a DSP may not
necessarily fix your needs s
where a true front end filtering system will., in many cases.. Food for
thought, anyway.

Subject: HTs for HF

I'm in the market for a compact (handheld would be ideal) SSB/CW HF
radio and was wondering if anyone has any experience with the "Pico
SSB/CW Tranceivers" sold by jCom. They are single-band SSB/CW QRP (2
watts) tranceivers in a full-size handheld package. I came across and
ad for these radios in an old issue of _73 Amateur Radio Today_ (1993)
but have been unable to contact jCom and fear they may have gone out of
business. I believe the radios are manufactured by a Japanese company
and hope that someone may be able to refer me to another source.
Alternatively, if anyone would like to recommend something similar,
I'd be interested in hearing it.

Hi Mike,

I'm using the Alinco DX-70 as a travel rig. I've been all over the place
with it and am very pleased so far. I dont use it mobile....I use it as
a suitcase 100 watt HF rig while traveling around SE Asia. Works fine, great
audio. Have a FT-890 too, but that rig is too heavy to lug around. Guess
it depends on your usage. In the mobile, the 890 is nice since it has the
built in keyer and ATU. Then again, the DX-70 is about 1/3 the weight but
omits the internal ATU and CW keyer.

From: nomer@southwind.net (steve nomer)
Subject: Is Kenwood loosing it or what?

I have one of those Kenwood 440s that has had frequency stability problems. I had the infamous VCO 5 fix made to the radio to get rid of the "glue" around the VCO that becomes conductive with age. The radio worked for about six months, then began to put out bad-sounding signals on first the higher-frequency bands, then spreading to all of them. The problem: once again, frequency instability. So far, I've been unable to find someone who can locate the problem. I've become weary of throwing money at this rig, and recently purchased a Yaesu FT-990 and am very pleased with its performance against any of Kenwood's rigs, especially in its receiver.

The only way Kenwood could ever get me back as a customer would be if they would recall the 440 and make needed repairs at their expense. As widespread as this type of problem with the 440s has been, I think this would be only reasonable to expect.

Subject: New Radio Shack 2 mtr mobile

I know Dayton 96 seems like a long time from now, but if you can wait, it may be worth it. Radio Shack usually has some great prices on their 2/440 stuff at the Hamvention. Who knows, by then, they may have new models of 2 meter and 440 gear out whivh will drive the price of the older models down even further. You may also want to look into Sttandard or Alinco rigs. They're not generally as pricy as some of the other radios.

>report so far. Anybody who has same problem? HL1DK/Lee

Several months ago, there were similar reports on this newsgroup
that the FT-900 had a CPU problem that caused the rig to shut
off mysteriously after a few minutes of operation. I dont recall
the specifics, but a firmware upgrade was required to fix the
problem.

I recall the 900 in question was being used as a repeater remote base,
and the periodic shutdown was very troublesome for the owner since he
was forced to return to the repeater site to cycle the rig off/on again.

Perhaps someone can offer more specifics that I.

Best regards and seasons greetings,

Joe BV/N0IAT

Taipei TAIWAN

ex 7J1AOF ex KA0ZDH ex YU3/N0IAT
Licensed Radio Amateur since 1986

The USA station that Joe referred to is NI6R in Brea,California. USA, he
took his FT-900 down to Yaesu USA, according to him, they shipped his radio
japan to fix it.
He has a company that builds HF remote control cumputer interfaces
for HF radio's.
That's how I learned of it, and I contacted the Technical Representive
named (Chip) at Yaesu USA in Cerritos, California.USA and he said bring it
in, we will upgrade to version 3, under warranty, for free , since then,
no problems, great RIG.
73
Mike

WB6DJI

Also, my brother hasa FT-900, WB6ZUF, had the same problem , he took his in, had the firmware upgrade, had it replaced at the Yaesu USA headquarters in Cerritos, California. USA.
The people in Japan may not be aware, since Yaesu USA took the lead here, to fix the problem, by upgrading the radio's in the USA, and Japan just upgraded the CPU firware, with thinking that the Main Field Offices like Yaesu USA, Yaesu Europe would do the CPU firmware changes in their facilities.
I believe there is a communications problem there on you end, I suggest you have Yaesu Japan contact Yaesu USA.
Now, its a great rig!
Yaesu Corporation USA did not want to get a bad image here, so they really went out of their way to keep their customers happy.

From: jchol@aol.com (JCHol)
Subject: TS850 slope tune with CW filter

This is normal behavior. Not to worry. I agree that both filters are very effective working together, but either filter alone is a big improvement over slope tune alone. I use the filters and ignore the slope tune in the digital modes. Slope tune ssb is good.

Date: 19 Dec 1995 18:47:25 GMT
From: Tom Pfaffenbach <tvpfaffe@mail.delcoelect.com>
Subject: TV sweep tubes vs. RF output tubes

One of the finest "Sweep" tubes for ssb amplification is the 6HF5. Hallicrafters and Swan both
put this tube to good use in the late 1960's. Hallicrafters used a single 6HF5 in the HT-46 and
achieved an honest, linear, 175w PEP output. Operating conditions used a d.c. negative grid
bias set for 40ma @ 725 volts on the plate idling and 210 v on the screen.

Swan used a pair of 6HF5's in the 500C and achieved an honest, linear 350w PEP output with a dc
bias at idle of only 20 ma for each tube (40 ma total) at 900 plate volts and 250 screen volts.

The 6HF5 has multiple r.f. grounding connections for the screen and cathode, which allow stable
design at very high gain levels. These tubes make use of the fact that the average powerlevel

in the human voice is 10 or more db below the peaks. Their high perveance design means that
they do not work very hard at all in amateur SSB application, and will last almost
indefinitely, if they are not destroyed by careless tuning. On a voice peak they may have an
instantaneous plate current of 250 ma per tube. That amounts to an input of 10X the plate
dissipation,

Historic application of 807 and 6146 vacuum tubes in amateur equipment usually set dc input
power at 3X the plate dissipation level, but this was based on approximately 70% class C
efficiency, not the linear AB modes or the 10-20 db variation between peak and average drive
levels.

The repeater system we have here is running a RLC2 with phone patch. We are running three repeaters, all on different bands. We have great success on using duplex autopatch via RX on one band and TX on another band. In theory we could have a duplex system if we took one of the repeaters off and put in another repeater and the same band just separate the antennas or get a combiner??? But none the less, duplex autopatch is capable via amateur radio, I use it all the time.

If I am not mistaken, I think HRO has a section of their catalog that deals with patches...I THINK there is a few duplex patches for sale in there...or give them a call.

5892. Murch UT-2000A, "ultimate transmatch" questions

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-20 00:00:00 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <7558.819500179@safety.ics.uci.edu>
Source record: 208377
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

Anyone familiar with these? I just picked one up at a very good price
and it looks pretty good on the inside. It covers 80-10 I am told,
and the roller inductor looks right for the job.

Did the UT-2000B cover 160? If so, did they switch in extra inductance
or add a longer roller inductor? I would like to add 160 to my UT-2000A
and suspect it is a simple job with a sturdy switch. Or maybe I can
find the UT-2000B for my 160 antenna :-) .

Also, I think I recall someone on the antenna group stating that the
"ultimate transmatch" design had one of the capacitors doing something
silly.... There is a two ganged capacitor that is doing something
useless? Just wonder if anyone remembers the comments or has a reference
to it.

Thanks.

-> I recently (2 weeks ago) got a new Kenwood TM-742A from AES. After
-> deciding to mod it using the mods found on oak.oakland.edu, I opened
-> up the radio, found the resistors you have to move, and, after
-> verifing what I saw was correct, realised the mod was already
-> complete. It came from the factory in (according to the mod on
-> oak.oakland.edu) is moded. However, I don't get the results of the
-> mod in the frequency range(or the 800 Mhz band)
->
-> Does anyone have corrections for it?
-> Does anyone have any more mods for it?
-> Does anyone know where the Mars/CAP wire is? I looked behind the
-> front cover where I was told I'd find it but it isn't there.
-> And
-> guess what - I didn't have the Mars/CAP capibilities either.

And the bad news is you probably won't be able to get it either, since
it was probably made after a certain date, and all companies such as
Icom, Kenwood etc complied with the law and made them so they couldn't
be modable like the earlier version were. I found that the hard way too,
and used the radio as it was advertised.

I believe the author might be surprised to discover how many hams are
microcontoller literate. Furthermore, offering the flowchart can be
helpful but why was the firmware not offered to those who are interested
? I can only assume that he is witholding it for the reason of personal
gain...to sell pre-programmed micros to interested builders.
And his comment about the flowchart getting snubbed by QST (space
constraints ?), the ARRL has several means of offering the firmware
electronically...by BBS, FTP site of WWW.
Why did he not request to have it posted there ?

I meed some parts for busted radios.

Display for Yaesu FRG9600. It's a big vacuum fluorescent on the front panel board. Consider the whole board to reduce chance of damage to display.

Recieve Crystal for Kenwood TH-21AT. It's X2 on the schematic. Unfortunately, Kenwood sought not to put the frequency on the schematic. The frequency of oscillation is not what's marked on the xtal, and neither are the frequency it needs to be to make the radio work. I bought it used, so don't know if it's the stock xtal. Receive freq is about 10KHz off. If someone has a service manual, I'd appreciate knowing the correct frequency and part number for the crystal.

Has anyone found a way to repair the "lip" that holds the bottom of the battery on. Every TH-XXAT I've ever seen has a cracked lip. I'm considering making a small brass part that either stuffs down between the metal radio enclosure and the plastic outer case or solders to the top shield. Any ideas?

As I recall, the replacement case comes with a touchtone pad. So there ought to be a bunch of old touchtone pads out there in junk boxes. I'd like to try to modify one to make an encoder for a Standard C508A. Anybody willing to part with one?

thanks,
miker

TM-742/942 Extended TX/RX Modification
ASI-0002, Feb. 23, 1993

This is a summary of the modification provided by Kenwood to expand the
transmit/receive ranges for the TM-742/942 tri-band radio. The sheet is
ASI-0002, subject "TM-742/942 Beyond Mars/CAP Mod. Guide" and date
"February 23, 1993". The actual ranges of what the radio will transmit
are wider than what is stated in the table below.

Note: this mod involves desoldering and resoldering chip resistors, if
you are not an expert in soldering chip components, get an expert to do
this for you.

1. Remove the front panel.
2. Remove the bottom cover from the radio.
3. Looking at the exposed bottom of the radio, orient it so it matches
the diagram below.
4. Move the three chip resistors as shown in the diagram. The numbers
"1" thru "8" represent the positions of the 8 chip resistors in the
original positions from the factory for U.S. radios. The "x" is an
empty pair of pads where the numbered "4,7,8" resistors should move to.
5. Reassemble the radio and reset the microprocessor (see manual).
6. Frequency ranges will be:

28 Mhz band: RX: 18.0 - 54.0
TX: 26.0 - 45.0

50 Mhz band: RX: 40.0 - 90.0
TX: 46.0 - 76.0

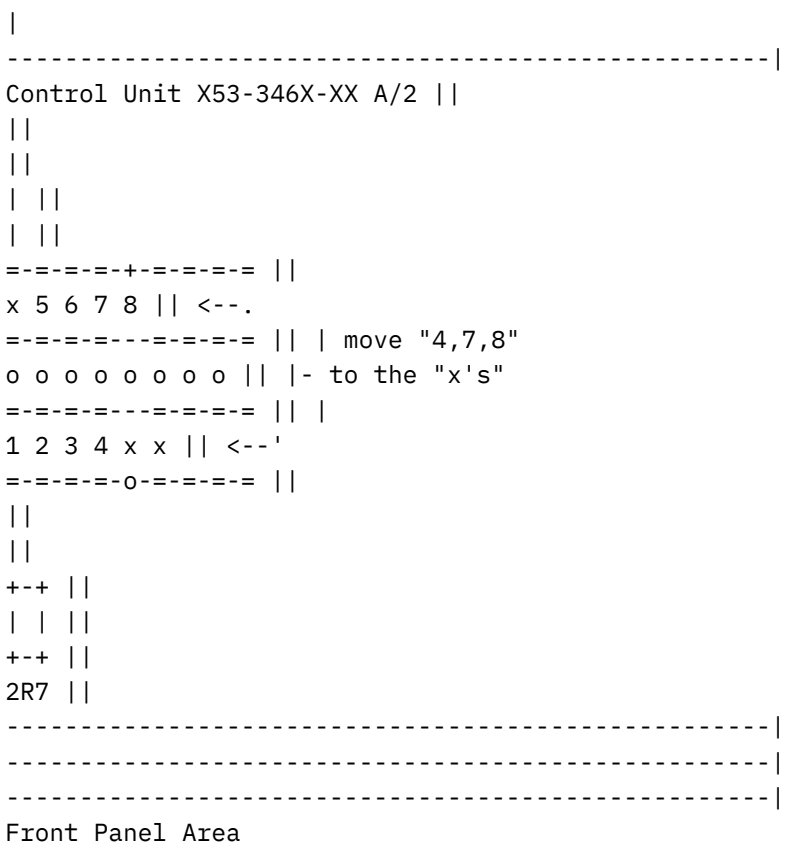
144 Mhz band: TX: 136.0 - 174.0

220 Mhz band: RX: 215.0 - 260.0
TX: 215.0 - 235.0

440 Mhz band: TX: 420.0 - 450.0

1.2 Ghz band: RX/TX: 1100 - 1400

Notes: not all radios will be able to tune the entire range.



END

I can't imagine why you'd want to run 1/2 hour continuous carrier, but maybe you do... In any event, I have an AL-1200 and run it almost exclusively on RTTY with it's 100% duty cycle. No matter how long-winded I get, on what band, it just chugs along, nice and easy. Granted, I haven't used it a lot on 10 due to the sunspot cycle, but I have used it a lot on 15 and it seems just as happy there as on any other band. RTTY is tough on an amplifier and the AL-1200 handles it with ease.

There was one thing I didn't like about it's design though. The step start circuit didn't seem to be very effective in giving a nice slow inrush current. The actual delay was only a few milliseconds, and the arc at the relay contacts was way too much in my opinion. The flash lit up the whole back of the amplifier! I removed the factory circuit and installed a time-delay relay with a larger value inrush resistor, and now it is much better behaved. Or at least I feel better turning it on. Granted, it's a nuisance to have to fix what the factory should have (again, in my opinion), but I'm still many $$$ ahead of having to buy an Alpha or something. And the signal is the same.

One BIG advantage to the 3CX1200A7 for me is the instant warm up feature. By comparison, the 3CX1500 needs THREE MINUTES to warm up -- an eternity when the

DX is calling! With the '1200, it's ready to go in less than five seconds. Just about like a 3-500Z, in fact. This means I can leave it off while I'm just tuning around. With a -1500 I'd want to leave it on all the time just in case.

The AL-1200 is a great amp -- I highly recommend it.

Count me in as one that was offended by the publication of such an article without source code. There is little to be learned by such a design unless the code and algorithms are published. Otherwise you have a pile of coils and relays and that's been well known for many decades. I suppose such an article is slightly better than none at all, but I did think this was _AMATEUR_ radio, with learning & teaching a priority. A secondary concern is the inability to repair a failed unit except by dependency on the author's enterprise.

The chip version in use has 512 bytes of EEPROM as it's entire machine code store. For the 6811 this should amount to maybe 350-400 source instructions, or less if there are data tables involved. The function could not be that complex, and perhaps someone could write their own code for the hardware and publish it. Putting object code into a blank 68HC11 is quite easy and can be done with a PC+serial port, and a bit of software. No weird "programming voltages" or other circuitry are required. Maybe publish the replacement code in a subsequent magazine article.

I seem to recall that all but the earliest versions of the chip have a flag that can be set after the programming process that renders the EEPROM unreadable when the chip is rebooted in it's "boot load" mode. I don't have my 6811 manuals handy to verify this.

Oh well, welcome to the 1970's.

As I type this the 'brown truck guy' is hopefully enroute to deliver a 706 to my door.
As part of my EC team efforts I have the need to monitor CB channel 9 (27.065) here in the shack/office. Currently that need is filled by a scanner and a tatty, and space consuming CB that I would love to see less of.
Will the 706 be able to fill that gap, or be modified to do so without turning it into an expensive and illegal CB radio?
Thanks for any help.....

Several months ago, there were similar reports on this newsgroup
that the FT-900 had a CPU problem that caused the rig to shut
off mysteriously after a few minutes of operation. I dont recall
the specifics, but a firmware upgrade was required to fix the
problem.

I recall the 900 in question was being used as a repeater remote base,
and the periodic shutdown was very troublesome for the owner since he
was forced to return to the repeater site to cycle the rig off/on again.

Perhaps someone can offer more specifics that I.

Source record: 208527

Please - take some advice - if anyone is considering purchasing
a radio for the holidays do not buy an Alinco without some serious
homework - Do not let the SOMEWHAT cheaper price trick you into making
a very bad purchase - The quality of the product is very poor - Go to your
local dealer and take a look at the workmanship of a ICOM vs the
Alinco

Ask some experience ELMERS about the Alinco track history
(it has not changed in the last couple of years) - The mechanical and
electrical design of these radios are very poor - It is worth the extra
money for the better quality and support. A couple of years after the
purchase you will be a much happier person.

Just venting some emotions about Alinco products after a friend
was considering a DR 600 mobile (the ad and price where nice) - I did
convience him of NOT making the purchase and he bought a Kenwood

Good Luck

This keyer may have been made to key a negative line, like those used in older grid-block transmitters. Unless you can obtain service literature that shows an easy conversion, my own solution would be to use a reed relay to key the rig. They're available from Radio Shack in both 5V and 12V versions, and you may even be able to fit it right inside the keyer. FWIW, I've been building and using strictly homebrew keyers for almost 30 years. Every one of them has used a relay and it's the one part that's never failed. :)

I know of about 15 people who own DJ580's in this area and only I have
had one small problem with my radio, the reset line gets held if I turn
the radio off for a few minutes for some reason.. Other than that, the
other 580 owners as well as the other people I know with mobile Alinco
rigs have not had a single problem I know of. Tell us your experience..

>Just venting some emotions about Alinco products after a friend
>was considering a DR 600 mobile (the ad and price where nice) - I did
>convience him of NOT making the purchase and he bought a Kenwood

Again, please give us some kind of reason why you feel this way. Your
message is all opinion and no facts.. If you want to convince someone
to not buy something you would be advised to present more facts than
opinions.

I can understand the original author's feeling about not wanting to give a product away to a potential commercial pirate, but I also feel uncomfortable with "single-source" parts, and sometimes would like the capability to customize the unit to my prefernces.

I'd like to see the ARRL get the code for any projects, and hold it in escrow in case the original supplier can't or won't provide support in the future.

I'd also like to see general source code availablility, since I have been known to make modifications both in the hardware and software of various projects. In a lot of cases, the code is as necessary to the project as the schematic, and more so than the PC board layout.

I could never write all the code for a video terminal, but I could and did modify the keyboard code of several commercial video terminals, using just a EPROM programmer and a clunky cross-assembler to work out patches. In some cases, the code was readable enough to make the changes, in other cases I could get a listing of the code fragments that were appropriate.

In some cases, I'm sure people are just self-conscious about their code. In others, there are reproduction rights issues, but I'd like the ARRL to TRY to make as much of a construction project available as possible, even if it means publishing an review of an available kit, as opposed to publishing an article on the same item as a construction article.

Hello, I have an Alinco DJ-G5T now, so if anyone else out there would like to discuss DJ-G5T features, please let me know. Maybe I could put some web pages about the DJ-G5T on my http://www.kb7eec.ampr.org/ server (which is usually connected via the 431.75MHz wireless 9600bps computer network here in Salt Lake). Or perhaps in http://www.xmission.com/~crum/.
I haven't heard of anyone else in my area with a DJ-G5T.

So far the DJ-G5T is really great -- the memory system, channel scope, lamp, separate mic and speaker for full duplex autopatch use, second PTT button, everything -- the three worst things to me are its slow DTMF sending speed, button-press volume control, and how a band must be the main band for DTMF squelch to work.

From: jmleveron@socketis.net
Message-ID: <4b8uq4$pem@news.socketis.net>
Source record: 208537

Hi,

Does anyone have any info on the Standard C-112 VHF handheld? I picked up a pair of them in Japan in 1992. It has ten memory channels. The variant I got only runs 144-146; 46-48 is somehow "locked out". It has four main front panel controls; on/off, call, MR, MS. When shifted via the Func key, they are Set, Rpt, MW, and Lamp.

Does anyone have any possible sources for a manual, or a manual for a similar model (my manual's in Japanese, hard for this Gaijin to read). It also only has the clamshell back battery compartment for 6 AA sized alkalines; anyone know of a compatible Nicad pack?

Any info on potential mods to access 146-148 (or MARS/CAP, or "wide-band")? These little radios have been good to me, and I'd like to get them up to full potential. Also, one of the units serial # is 92F10005x

Thanks in advance for any replies! 73 de John <jmleveron@socketis.net>

Is Kenwood loosing their ability to manufacture solid equipment. I had a 440 a couple of years ago and it lost it's ability to lock the PLL. I found out that was a very wide spread problem and you had to have a major repair to correct it.

3 years ago I purchased 3 TM241a's (a 2 meter set) Now all three of them are dieing almost at the same time. The audio goes out intermittently and one of them has no CTSS tone out. And the LCD dispaly goes hairy intemittently.

Now I don't claim to be a rocket scientist but with me Kenwood has failed me 80% of the time. I have owned 5 Kenwood radios and 4 of them have failed. All of the failures have been wide spread failures that in my opinion should have been recalled. Everyone on the local repeater knows of the 241's audio problems.. They'll say, "... yeah mine did that too. I replaced the microphone." or " Yeah I had to send mine back for repair." Like I said these are wide spread problems.

On the HF rig, Almost anyone on the air can tell you to beware of a 440 (a certain serial number batch) because of this phase lock loop problem with the 440.

I am looking at the TS850AT but I can't get the courage to purchase it. Frankly I'm gun shy when it comes to Kenwood now. I certainly don't want to tie alot of my money up in a product that is bug ridden..

Anyone else having similar problems..... :o)

I am posting this for Bill Miller, KQ4UN (803) 538-8962

He is looking for an antenna tuner that will cover 160 m and will tune a balanced feedline (like open-wire line). Please call him at the number above. Do not reply to me. I am just posting it for Bill and he has no access to this group or e-mail.

73,

Michael Crestohl, KH6KD/W1

You bet they help. I couldn't live without one anymore. Forget the
Radio Shack one, but most of the rest will do a good job.

From: 76500.1621@compuserve.com
Message-ID: <4b8tq5$66d@dub-news-svc-5.compuserve.com>
Source record: 208542

Kris,

My 850 acts the same way. I have the identical filter setup. When using the slope with cw the low cut is all the way around to about 1-2 o'clock position. The high slope barely away from its default.

I now use a Timewave DSP and never play with the slope. But I did use the slope a bit prior to the DSP. Good luck.

>So, someone suggested that we buy a Radio Shack pocket frequency
>counter for $100.

Checking your transmit frequency with a counter is a real pain.
Also, if you don't have a dummy load, it's potentially illegal (if
you check "live" and you're out of band, you've just made an illegal
transmission).

What you really need is a 100KHz-50KHz-25KHz crystal calibrator.
These generate accurate signals you can use in *receive* mode to
calibrate your rig. Ten Tec used to sell them, so you might call
them first. Otherwise, you'll probably need to shop the hamfests or
build one (they're very simple to construct).

Incidentally, there's nothing wrong with an analog dial, but you do
need the calibrator to stay legal. My Yaesu FT-101EE had to be
calibrated every time I changed bands, but it was so quick to do that
I didn't consider it even a minor inconvenience. Don't sell the
Century short - there are some very fine pieces of equipment out
there with analog dials.

Source record: 208544

>> When I added the YK-88C-1 500Hz CW filter to my TS850 the slope tune no longer behaves properly. The high cut cuts way too much and the low cut is completely ineffective.

Is this normal behavior? Is the slope tune supposed to be useful for CW when optional filters are in place?

The YK-88C-1 is for center frequency 8830KHz (1st IF). This is currently the only optional filter in the rig.

TNX. <<

I have that radio and filter combo and have no problem using the slop tuning in CW. I can make a nice narrow filter doing it. I have the CW note set for default. *800hz I think and I usually have both cuts set nearly at 12 o'clock. Hope this helps some.

Are you looking for a Japanese replacement? I wouldn't personally use anything but a Japanese part number, or the exact original part. Compared to the generic garbage, their quality is higher and their performance is much more consistent.

If you're working on a lot of Japanese equipment, there are at least two books published which contain specs for Japanese devices. One is for 2SA, 2SB, 2SC and 2SD bipolar devices, the other covers 2SK and 3SK fets. These books are published in Japan and they are the real thing, converted to English.

Also, the books are printed once a year and sold by MCM electronics, CEI and ORA, the same people who sell the parts. Sorry, I don't have a number for these guys, but any stereo repair shop should be able to tell you how to contact them. They all have 800 numbers.

73..
I have got an old IC-W2 VHF/UHF portable tranceiver.
This is not IC-W2A or IC-W2E, but IC-W2
The problem is I cannot switch on the shift (DUP) on VHF part...
It's really annoying for QSO on repeaters.
I can do it on UHF part and it works.
Another problem is I cannot have a 1775Hz tone major repeaters
IC-W2E and A have these functions...
Is it possible to change that ?
Is it the small chip on a card in the tranceiver...?
Please help me...

73 thanks
HB9UFQ

I know Dayton 96 seems like a long time from now, but if you can wait, it may be worth it. Radio
Shack usually has some great prices on their 2/440 stuff at the Hamvention. Who knows, by then,
they may have new models of 2 meter and 440 gear out whivh will drive the price of the older
models down even further. You may also want to look into Sttandard or Alinco rigs. They're not
generally as pricy as some of the other radios.

5933. Re: Do DSP's really help?

I did some basic investigation into the fesibility of using a DSP with my old FT-101E. After
talking to numerous folk regarding the effectiveness and cost comparison, I decided to upgrade the
radio, rather than dump a lot of money into an audio filter, which is basically what these devices
amount to. If you have a rig with a crummy IF stage, a DSP may not necessarily fix your needs s
where a true front end filtering system will., in many cases.. Food for thought, anyway.

Message-ID: <4b9336$81o@s2.GANet.NET>
Source record: 208551

Occasionally, a radio we buy doesn't work as we expected. It gets sent back to the factory, gets
repaired and occasionally may come back with more problems than i it left with. Maybe some other
ham friends had simliar experiences with the same model or other models within the same brand.
Welcome to high tech everyone. It's a machine for crying out loud, therefore it's going to break
once in a while.

All these manufacturers over time have had some problems with their design operation, warranty
and other facets of the products. Just because a couple of Alinco radios break, doesen't
necessarily indicate the entire company's product line is a piece of crap. We take a chance every
time we buy a piece of gear, albeit a small one.

I have a DJ-180T that's 4+ years old. It's been dropped, slammed and generally well used for that
period of time. Problems? A loose antenna connector. I rest my case.

5936. Re: Alinco Radios Are Junk

Newsgroup: rec.radio.amateur.equipment

I've owned an Alinco DJ-f1TH handheld forovertwo years now, and I'm as impressed with it now as I was the day I got it. It's built like a tank, compared with the fragile-feeling junk that YaeKenCom sell (I am a SERIOUS Kenwood fan, BTW). The F1T has lots of features, a really sensitive, solid receiver, great audio on tx and rx, and the batteries seem to last much longer than friends' YaeKenCom batteries do.

I also own an Alinco DX-70T mobile HF rig. It also has a good solid feel to it, and appears to be built quite well (had the cover off to switch it to 50w max output and did a little snoopin' around inside). Sure, it doesn't have some of the bells-n-whistles that the IC-706 has, but it also costs about $300 less. This little rig has the best receive audio I've ever heard through a built-in speaker. I've never owned a mobile HF rig that didn't need some kind of external speaker before (I've used an FT-757GX, a TS-130S, a TS-430S, an IC-730, a Scout, a Uniden 2510, a Uniden 2600, a Realistic HTX-100, and some converted CB radios). The DX-70T is _NOT_ perfect by any means, but for their very first attempt ever at an HF rig, it's a real winner, and WILL give Icom and Kenwood a run for their money.

I would be interested in hearing _exactly_ what kinds of problems YOU have had with YOUR Alinco rigs. I know many hams in the Dallas area who love their Alinco rigs, and few who have anything bad to say about them.

A number of HF rigs appear to offer complete control via detachable face-plates, including the Alinco DX-70T, Yaesu FT-900 and Icom IC-706.

Has anyone successfully operated any of these at significant distance? I would like to know of anyone who has managed to extend the distance between the front panel and the faceless box to around 70m (say 250 feet).

I agree with the new PCS, but I thought (FCC rules and regs) part 15
made some restrictions on operating range??? 60 miles???

Aren't we talking two very tall towers??? to achieve line of sight?

I don't think he wants to put up a ship in the middle for a
repeater:-)

Might want to look and see if Ma Bell or anybody else is jumping that
span with a terrestial microwave that you can either hop a ride on
(for a fee of course) or borrow some tower space (probably also for a
fee) and bounce from your office to the tower then to the tower on the
opposite beach and on to your other office.

BTW if you are trying to connect two networks? go for more bandwidth,
you'll need it almost as soon as you get the two nodes connected
(voice of experience:-)

I agree that there are a lot of hams who are knowledgeable about
microcontrollers and have the necessary equipment. Another issue is that
the authors may not want to be burdened with inquiries from those who are
not sufficiently knowledgeable. It can be a real pain. I think the source
code, and flowcharts if they exist, should be made available and
distributed BY ARRL but with the provision that they are supplied on an
as-is basis and that the authors will not answer any inquiries.

Very interesting...I have some Kenwood's (241's etc) and Alinco's
DR-150 and DJ-G1. I have tons of trouble with all my Kenwood's
Ts-430, 940, 241, and no trouble with Alinco...quality seems to be
fine on Alincos over last few years..I agree with a past post that
Kenwood should have a re-call on their 440's and all their other
rigs that have a high incidence of the same problem...I will not
buy another Kenwood and pay for their mistakes...

: >capability also looks like a bonus.

: >Stefan, G0BJW
: >CompuServe 100627,3426

: I did the expanded freq mod found at http://www.qrz.com, and it works fine.
: One solder jumper to remove, and it covers

If you unsolder jumpers #6 and #7 you will be able to tune the radio from somewhere around 80 Mhz to 999 Mhz... but the radio doesn't actually receive out of bounds... but you will get full receive from 110-180 and 320-512 Mhz... and full transmit from 100-180 and 390-484 Mhz. So that is a good thing!

: There may be more coverage, but I haven't poked too much at the keyboard
: yet. It seems to auto select AM mode in the 110-140 band, and can be
: forced to AM or FM anywhere. Of course, the AM/FM mode selection can be
: stored in a memory along with the frequency.

I believe it is selectable if AM mode comes on automatically when the frequency is in a certain range.... As I remember you can turn this feature off... I just glanced in the manual and didn't see anything on this but I still think this is the case.

Hi Tom here:

I have a mint Icom R-71A reciever. It is in very good cosmetic shape
an works like a charm. It has no options in it, just like I bought
it from AES <new>. It is capable of working as a 2'd recvr or stand
alone recvr <muting circuit built in>... It Rx from 60hz - 30mhz
continuous from the factory all mode capeable <AM, FM, CW, SSB & RTTY>

Reason for seling is that I have acquired a Ic-7000 with a built in
Hf converter. This unit will recv from 30hz - 30mhz on the built in
converter; an from 25mhz - 2.975Ghz continuous... I don't need 2 rigs
in addition to my 751A & 765 Icoms which also have Gen coverage...

It comes with manual, box & acc kit from Icom in ready to go condition.
Non-smoker, $850.00
Tnx for your interest.

Source record: 208396

I own two Alinco radios (DJ580T, and DR600T) and after about a year and a half I am still very happy with them. I admit that they are not perfect but what is?
The original slam on Alinco radios admitted that they cost less. It should also be pointed out that batteries, chargers, mics, etc. are also considerably cheaper than most other brands. I also like the drop in charger that came with my DJ580T, I didn't believe a friend at first when he told me that he had to leave the batteries attatched to his Icom W2A to charge them unless he purchased the fast charger (over $100) The Alinco's standard charger can charge one battery while the radio is using another.
I also like the mods. If you ever wanted to expand the transmit or receive range on either of the Alinco radios that I own you just cut the blue or red wire. This seems easier than desoldering surface mount diodes and resoldering them, along with a few extras that must be purchased.

But hey......I'm just a tech so what do I know?

Also - check to see if your monitor is at fault - find the birdies, and turn it off. If not then you will need to move the monitor further away (may work) or consider a newer model which meets current EMI stanards. In my case - I no longer have monitor problems at all where in the past it was the primary culprit.

MFJ sells a 6m SSB rig, but not a 2m version. Price is $239.95. Power output = 10 Watts PEP. VFO control, with RIT also. Works SSB and CW. Rcvr is single conversion superhet.

Sorry the info is "sketchy". Got it from AES catalog. Best idea is to write or phone MFJ and ask them to send you the manual for the radio, which they will do for free!

>the noise from distant thunderstorms?

From my experience (555 Scout in mobile operation, and 556 Argo
at fixed station), the noise blanker is without a doubt one of
the most worth while accessories you can buy for your Scout.
It's extremely effective in eliminating car ignition noise and
"local" electrical noise (power-lines, appliances). It's well
worth the price ($19.95 US). I couldn't operate without it
(quite literally). At the fixed station, it brings an S7 noise
level down to an S2. It does not seem to filter out noise
generated by my television, however, and I am not sure how well
it would reduce noise from distant thunderstorms.

Source record: 208407
Cross-posted to: rec.radio.shortwave,alt.radio.pirate,rec.radio.amateur.equipment

Lincoln Thormahlen (thor@dodo.crown.net) penned:
: Has anyone tried any of the DSP audio filters?
: Which one(Radio Shack, JPS, MJF, others)?

: I am mainly interested in voice (AM, SSB) notch filtering and noise
: reduction. I would be using the filter with a Drake R8A in the
: pursuit of "Free Radio Stations".

: Thanks in advance.

: Lincoln Thormahlen
: thor@dodo.crown.net

I use an MFJ-752 with my Kenwood receiver, and it helps on some weak signals, especially CW and other narrow band stuff. But for AM voice, there is no substitute for good IF selecctivity in your receiver. What I mean is that the audio filter will not make up for the poor receiver's IF selectivity letting in other stations close in freq. If the receiver picks up another station, the filter may get rid of the heterodyning, but the receiver may still be desensitized by the strong signal. That means that the signal you want will not be heard as well, if at all.

I've got a decent receiver, and the MFJ helps a bit. But it is not a DSP filter. The DSP may be better at some things, such as notching out a certain freq. But I don't believe that it will be any better at receiving weak signals when the receiver is not picking them up well.

I noticed that the receiver you're using is a good one, so you should be spending money on the other end of the receiver, to get a better antenna. This might allow you to use the antenna to reduce strong stations and maximize weak ones.

If you do get one, don't be surprised if you are disappointed in the filter. The one I have requires a lot of knob adjusting to get it to be optimum. The success of the user depends a lot on his skill at adjusting the filter. I think that some listeners such as hams would get decent results since they are listening to DX and especially CW. For someone who wants to listen to the AM broadcasts, I doubt that the filter will be as successful.

I haven't used the DSP filters, but if they are like the MFJ, then they will probably require a lot of manual adjustment.

REmember that no amount of audio filtering will get rid of fading, QRM, and other problems. If you have the land and the money, you can get rid of fading by space diversity reception. That's when you put two antennas

a couple hundred yards apart with two separate receivers. The best of
the two audio signals is used. That's how the military used to do it.
Now they put up a satellite dish and receive the AFRTS over the military
satellite!

Source record: 208412

Now that I've actually seen the article, I have no problem with what was done. The article gives enough information to make a version of the tuner, with nothing but the information given, if you're knowledgeable enough about microcontrollers. In fact, you could control the whole thing with a PC if you wanted. It wouldn't be too hard to make connections to the PC board where the processor would normally be, and connect it to a different processor. I can envision one of these with a PDP-10 controlling it, since I am of that generation.

I think the keyer project that was the previous cause of these flames was much more of a "review of the kit" type, since no hint was given about the internal workings of the unit. QST has also had other articles that did provide the source listings, not in the magazine, but available in other ways.

5969. IC-706 Matrix Filter Bank (technical Info)

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-21 00:00:00 UTC
From: aust@gandalf.sp.TRw.COM
Message-ID: <9512211806.AA09459@shelob>
Source record: 208413

All you IC-706 owners, the technical types, engineers into ham
radio like me. After getting my IC-706, I have been fasinated by
its design.
Now I am making it one of those Engineering Projects at home,
similar to my work!!. Ham radio is fun, reverse engineering is too!
From my understanding on the IC-706 filter bank is this.
As far as the IC-706 is concerned, this is what I have.
Between 60.000 and 128.999999 MHz,
a high-pass/low-pass filter pair is used.
Between 129.0000 and 143.999999 MHz ...AND BETWEEN 148.000001 and 200.00 MHz
another high-pass/low-pass filter combination is used.
BETWEEN 144.000000 and 148.000000 MHz, a separate band-pass/low-pass filter
set-up is used.
****
Next I need to identify a maxrix of which wires and logic levels
control each filter, and if the filter is used both in the transmitter
and receiver path or both. Trying to figure the logic diagram in
switching as one tunes the receiver/transmitter from 60-200MHz to
understand which filters are activated in the filter banks.
Next I can implement my special design microminature filter which is
varactor tuned from 50-200Mhz (similar to another helical design in Japan), a
136-174 varactor filter into the filter compartment. This filter is .38"x .5",
with 5MHz BW and with the right Mhz/volt tuning ratio can be slaved off the VCO
ramp test point to drive it into a log amp to linearize the tuning range.
From a frequency analysis/spur LO injection, I have figured the higher
order mix products and images for the LO with harmonics, with more information
that I received from Icom.I can really appreciate now why they needed all those filters so
that the radio would be usable without image/mix products falling
into the IF with undesired sideband products.
Still awaiting the service Manual, before I really get into it. Icom
claims the Manuals to be out in January 1996.

I'm looking for a UHF FM receiver. I'm fairly new to
the hobby and want to try working AO-27. I have the
gear for the uplink, but need something for the downlink.

If you have an old receiver or scanner that you could
part with for low cost, please e-mail me at:

davidms@decus.ca

Thanks!

You do not need any ground except the earth ground provided by the mounting pole. Mine is mounted 5 feet above my back yard and has been a great performer. Adding radials of any type will probably make the antenna work worse.

Source record: 208419

Saw your info on FT-51R, I believe that the FT-51R will go higher than
484Mhz, even receive better, using the high side LO injection VCO
(Reserved for VHF side of the DISPLAY) if you use in UHF X UHF, rather
than VHF x VHF, my TH-78works the same way. There are TWO VCO's in the
TH78 on UHF and two VCO's on VHF.
When listening to UHF x UHF, both UHF VCO's are working, One VCO is using
low side LO injection, the other VCO uses hi side LO injection, allowing the
sideband IF product to fall within in same IF.
Thus one using the VHF side for UHF operation, you use high side LO injection, and the PLL
will stay in lock usually 20Mhz higher than the other VCO.
Also, you may hear better with the higher side LO injection VCO on UHF above
490 due to higher LO drive into the mixer and image response will fall above
the desired RF frequency. When using low side Lo injection, the image falls
below your desired RF frequency. The Front end is broadband and usually rolls
off as you get above 510, so the image noise sideband does not degrade the RF
to IF noise figure as bad when your using the low side LO injection.
I keep forgetting that a lot of hams are not engineers, but remembering this
could be helpful for you.

> detail goes into programming source code.

How is the code in a microprocessor different from the designs in any
circuit? Both require a great deal of skill and knowledge to develop
and perfect.

> Additionally, there is
> nothing to inhibit the ambitious and determined amateur from learning and
> writing their own code and sharing their experience with others.

The same can be said of any design work done in any field. Roy
Lewellyn and others could keep all their designs to themselves
(proprietary?) and none of us would benefit from their hard work.
On the other hand they can write articles or books, get paid by
the publishers, and we can benefit from their work.

I just don't see the difference between software and hardware
design. It seems to me that an analog would be to publish a design
for some piece of equipment and label a portion of the circuit
"black box, only obtainable from the author for a fee".

Personally I don't know why the code wasn't published. As Ed has
pointed out, the author isn't making any money on the code as he
is offering programmed devices for a little more than they cost
unprogrammed. But as a software developer and part time
tinkerer, I'd love to see his code to see exactly how he cut down
the number of attempts required from 131K to 280 or whatever
the numbers were. Its also an area that I've thought about
doing some design work after seeing the ads from the SGC 230
tuner and thinking to myself, how hard can something like that
be to build.

I guess all in all it doesn't bother me a great deal, but the trend
is rather disturbing. I ran into this guy at a hamfest last year who
was giving talks on APRS. His apparent goal is to make a pile
of money off of selling Mac APRS software. He is welcome to
make amateur radio his source of income, but in the end, we

all lose. The amateur radio software community as far as
I can tell has been much more close to the vest than the electronic
design community has. I'm not sure why this is, but it is frustrating
that we don't have a wealth of software designs to share
and build upon. This is one area where I'd love the see the ARRL
step in and help coordinate efforts. Imagine the library
of code we'd have if much of the currently independent efforts
were coordinated and moving in a single direction.

Enough of my soapbox.

5977. Re: Alinco Radios Are Junk

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-21 00:00:00 UTC
From: crum@xmission.xmission.com
Message-ID: <4bci71$f2t@xmission.xmission.com>
Source record: 208421

In article <4b8ci3$oke@violin.aix.calpoly.edu> kjsmith@violin.aix.calpoly.edu (Kirk James Smith) writes:
I'm not sure why I'm ranting, I'm not a rabid fan of Alinco, they've made some design errors in my opinion as well, but I think they're the best one going at the moment (save buying Motorola Syntor X 9000's, which are a pain to use due to the computer programming if you travel much).

I guess you meant "raving" instead of "ranting". I have similar feelings. I like Alinco radios a lot, although some design aspects bug me a little.

My new DJ-G5TH is really cool. It is really Fun. Funner than the DJ-580T. It improves upon the 580 in many, many ways, but in a few little ways it is worse. I had a 580 but lost it while hiking as I mentioned in previous postings.

Like:

1. The PTT button of my G5 is hard to press, and after pressing it, it will disconnect if I release a little pressure, even before it "unclicks". Maybe this will be less of a problem as the radio gets older.

2. The G5 has up/down buttons for volume and squelch level.
I like knobs for volume control. (My Standard C5718DA mobile dual-bander also has buttons on the mic for volume control, although it does have knobs on the front panel. Kudos to Yaesu for the cool knobs on the FT-8500 FS-10 microphone.)

3. I don't see any way to set my G5 so that when I key up, the sub-band is muted completely. For use with another radio one-way cross cross-band repeating to get into a repeater, while listening to the repeater output directly, the "full duplex off" mode of the 580 (apparently lacking in the G5) was quite appropriate.

4. The 580 had an undocumented feature (F-FL/PL #123) that allowed me to set the DTMF tone sending speed to be really really fast. I really miss that. The G5 sends tones quite slowly, and there isn't even a slow/fast setting, let alone the 16-level speed setting that the 580 has.

Well, there are my little picky pedantic complaints. Maybe in another message I could list good things about the G5. There are lots!
Well, I can't resist briefly mentioning some:
- lots of memories (200), and two VFOs (a,b) for each of the L and R bands,
- call channels maintain settings like PL and shift (bugfix over the 580),
- 20 DTMF memories, and 8 DSQ memories.
- channel scope (but received frequency seems to be periodically interrupted)

- sleek shape

Hey, I wonder if anyone has made a computer program to receive, manipulate and send G5 settings (with a computer sound board), for functionality similar to the ADMS software for Yaesu radios.

>Radio Shack one, but most of the rest will do a good job.

Only forget the Radio Shack one because it does not really have any
"noise reduction". They got that all wrong. BUT, for basic CW
and SSB selectivity, and for $50, you can't beat the little thing.
I had the DSP 59+ and the Radio Shack filters, kept the Radio Shack
and got rid of the DSP 59+. The DSP 59+ was real neat, and did a
good job and all, but not $150 better for me, hi hi.

It probably DOES work. He says it only works a short distance so I expect that the recievers are having a spurious response to overload. The transmitters are probably blowing right around the duplexer and mixing with noise in the logic board.

5985. 5$ Mod. For Dead HT Batts!

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-21 00:00:00 UTC
From: cardenas@kaiwan.com
Message-ID: <4bcqqm$ie6@kaiwan.kaiwan.com>
Source record: 208429

New life/use for dead YAESU, ICOM, (fill in yours) Batteries:

If you don't intend to rebuild your HT batteries, here's another great option! It provides +12 Volts D.C.*, FULLY REGULATED! to your portable tranceiver or scanner from your car battery! All parts should be about $5! It's a very easy project that should take less than one hour.

First! Be SURE your radio will safely operate with 12 Volts D.C*.!
Open the battery case (see earlier article) and SAFELY dispose of the dead cells.

PARTS LIST:
(1) Motorola *MC7812* (or similar 'three legged' POSITIVE voltage regulator). Radio Shack has them for about $1.50 each.

(1) Metal plate, heat-sinc. 2" x 3" Almost anything will do. I used a official one that cost 50 cents... no drilling required.

(1) ,01ufd at 50 volts capacitor.

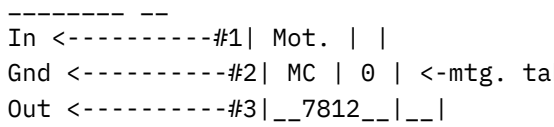
(1) .2 ufd at 25 volts capacitor.

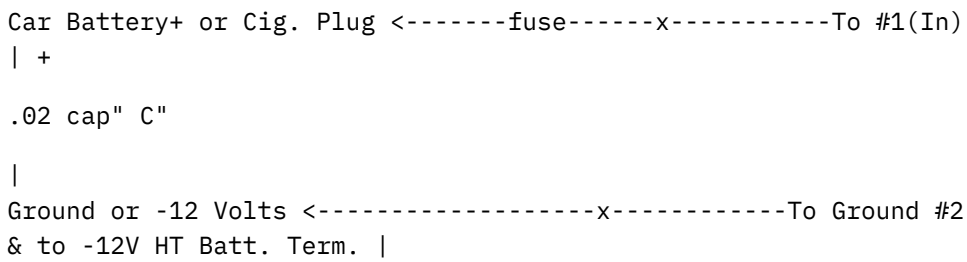
(1) One amp fuse with wire legs. (Fuse holder type optional)

MISC: 5 feet, light duty, 20 gage stranded wire (cigarette lighter plug is optional). One nut, screw and washer.

IDENTIFY the REGULATOR connections as follows:
(Body/Letter side up. Metal Mtg. tab is at RIGHT. Three legs point left.)

#1, Top Leg = +12volts to +24 volts INPUT terminal.
#2, Middle Leg = to Ground.
#3, Bottom Leg = Regulated +12 volts out.





.2 cap "C"
|+

+12 Volts Reg. to H.T. <-------------------x-----------To Output #3
+12 V battery term.

Everything was built inside 1/2 of the Battery Case. I drilled a small hole on the side of the Case for the twisted pair of wires to 12 volts. A knot keeps the wires from pulling out. I drilled another small hole to mount the metal plate that the regulator mounts on.

Be sure to use the two capacitors. They are important. I connected them directly to the regulator legs. The Output #3 is wired to +12 volts terminal of your HT Battery Case. The ground terminal (#2) is connected to the -12 volt terminal of your HT battery AND to the wire that connects to -12 volts from the car battery.

A hot glue gun worked fine for case re-assembly. Super Glue worked fine too.

On occasion, automobile charging systems cars can go higher than 16 VDC! This method will provide 12* volts, FULLY REGULATED to protect your HT, no matter what. The regulator also protects from voltage "spikes" and dead shorts on the output.

I've left my HT on for hours and hours (overnight or all day) and never have a problem starting.

*NOTE! If your HT or scanner requires LESS than 12 volts D.C., Select another regulator to suit your voltage requirements. Follow the same basic rules.

***Important! Any questions, please EMAIL me direct: cardenas@kaiwan.com

Enjoy! Tony Cardenas WA6IGJ

In "Reflections", Maxwell states that the lower portion of the split stator capacitor (which shunts the transmitter) contributes nothing to the matching function. He goes on to say that the same is true of the shunt output capacitors in the Johnson Matchbox, and that they can be lifted off ground without affecting the match.

In other words, according to Maxwell, these capacitors serve no useful purpose.

> WA4GZE

Hi Steve. I built one of the TenTec kits. It's the best $95 I've spent
on the hobby in years. It was easy to put together (the manual makes it
foolproof) and performance is excellent. I use in in my car with my
TS-50. I worked all over the place during this past summer Sporadic-E
season.
Everything is included in the kit from parts, connectors, wire and a
nice case. You couldn't build one from scratch for less...well worth it.

I recommend it highly !
Cheers..

Sounds like an oscillation. Have you changed or done *anything*
differently before and after the problem appeared? New finals?
Alignment? Neutralization?

Wow...who on earth would talk you into that? Spending a bunch of money on a radio that's obsolete seven times over and
will never compete with state-of-the-art rigs in receiver quality or in any other way, rather than spending *less* money on a
today's-technology DSP that can be used on the new radio when you upgrade? Any investment you make in filtering for that
old boat anchor will never be recovered.

To each his own, I guess. I'll bet a lot of telemarketing folks would kill for your telephone number.

5997. Comparing Tiny HF (w/6m) Mobile Rigs

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-22 00:00:00 UTC
From: rcarpen@DGS.dgsys.COM
Message-ID: <Pine.SOL.3.91.951221214049.17393B-100000@DGS>
Source record: 208441

Those posing the various questions about the new generation of tiny HF mobile rigs (some with 6 meters), should find a copy of the November 1995 issue of Radio-REF, the French ham magazine.

It includes a short comparison, mostly on specs, of the TS-50, FT-900, DX-70, and IC-706. They comment that the TS50 is still good for portable/mobile despite its age, has proven reliability, and well integrated features. They say the FT-900 is the most compete, technically. The DX-70 is the smallest but fairly complete for mobile use, but its robustness is yet to be proven. They mention the lack of strength of the connections to the removable panel, and that the rig's features are not very well integrated. They characterize the IC-706 as the newest and complete but the most complex to use.

They particularly disliked the TS-50's ineffective noise blanker and say the rcvr saturates on strong broadcast stations. They complained about the FT-900's noisy fan and that too many of its controls are on the rear. Again they comment on the DX-70's fragile cable and connectors to the front panel, its separate antenna tuner, no keyer, and inaccessible mike connector. As for the IC-706, the main complaints are complex controls and separate antenna tuner. (As an owner, I complain about its non-ham-band VHF intermod and sensitivity.)

For more info get a copy of the mag for the details, likes and dislikes.

From: turner@safety.ICS.UCI.EDU
Message-ID: <24199.819590347@safety.ics.uci.edu>
Source record: 208442

Anyone familiar with the Ten Tec Argonauts and the ALC light / drive controls? I have owned several 509's and always noticed the drive went to about 10 o'clock when the ALC light was fully bright. I now own a 515 where the light is not bright until I turn the drive control to about 1 or 2 o'clock. SSB is easier, when I speak into the mike, I can light the ALC light on a lower setting, but not by much. I use the matching electret mike.

I do not have a good wattmeter, but it seems, from my eye on my meter, to be putting out about 2 or 3 watts - which is less than the 5 or so my 509's put out on a regular basis. Ten Tec had replaced the final transistors about two years ago.

I have not taken the time to search the manual yet, maybe there is an alignment procedure for final bias and adjusting the ALC control for proper settings. Anyone familiar with this?

In <4b3mkl$2uu@info.epfl.ch> Mathias Coinchon <coinchon@fbwww.epfl.ch> writes:

>I have got a ICW2 (not A or E) tranceiver
>and i cannot have shift on VHF band
>but it works on UHF
>how can I do.....?
>Can we reprogram the tranceiver...?

The A, E and others are the same hardware (different aligned on
70 cm), with some diodes in the processor board changed.

Check the mod files. To make it an European version, order a
MA132K (D15) and MA132A (D22) at Icom and mount those; remove D16
if it is soldered in. Use proper ESD precautions.
These are 0102 SMD's so you should know how to work with those.

See if you can get the docs locally. If not, shout.

You should also find out if for 430-440, the wide, or the narrow
preamp is used (there is a helical preamp and a broadband one;
the broadband one is for 'scanner usage'). If it uses the helical
for 430-440, then you may have to tweak that a little to get good
sensivity down in the band.

Source record: 208448

Good article. There are a couple of things to watch out for. It should work fine 99.9% of the time, but I wouldn't want to be the one that's the .1%.

1)Make sure the fuse is big enough. My HT draws 1.3A on transmit. But don't leave the fuse out!!
2)The auto electrical system is very noisy. It's a good idea to put a FAT Zener on the output so when the regulator shorts, the fuse blows before the radio does. Do the math, but you might find that with all the tolerances and limits on your radio, you may have to settle for less than 12V nominal. You can tweek an LM317 to eliminate at least part of this. You'll lose the 2V regulator overhead in any case when the battery is below 14V.
3)Also a good idea to put some L-C filtering on the input to keep the regulator from blowing on a transient.

>that can do the job better. Maybe I will never get around to trying
>it. Maybe I will fail. Maybe I will toast the rig with a faulty
>design. For me, such an idea might just be sufficiently interesting
>to give it a whirl.

Experimenting is a good idea, it's fun and sure helps us learn.

But DSP's fast enough to do anything at a real IF aren't cheap, and neither are the A/D converters. Expect to spend several times what the 101 cost you if you take this route.

Ham manufacturers do radio DSP by using a very very low IF. So low it's almost at audio. So it's almost exactly like audio DSP anyway!!!!

Same some headaches and do an audio DSP. If you want to improve the FT-101, remove the exceptionally crummy mixers they used in that rig and redistribute the receivers gain. If you do that, adding better IF filters will help. As it sits, the 101 is front end and mixer overload limited, not filter limited.

> technical articles and engineering papers are for.

I see many ways to learn from construction projects.

1) You can learn construction and building skills.
I think it takes a fair amount of skill to drill
a 2.66 inch hole for a 3CX800A7 432 amplifier.

(As an aside, nobody has suggested we stop
publishing such projects because there
is no second source for 3CX800s)

2) You can take the author's ideas and design an even
better version. You ought to have a huge advantage
because the author has often done the hard work--making
the first working unit. Ever notice how textbooks often
have exercises to work out on you own?

3) You can study the schematics and run calculations/simulations.
What components have to be held to high tolerances?

Just suppose we hired an expert staff to take projects done
by amateurs and totally redesigned them in accordance with
"state of the art" principles. Would this benefit amateur
radio? Is there any difference between a membership journal
and a magazine?

Greg,

I have owned and used the Paragon II for almost a year and love it.
The receiver is excellent, the audio is great and puts my Japanese HF
rigs to shame. Get excellent reports on transmit audio as well.
Receiver probably not as quiet as your OMNI VI, but I still think it
outperforms mnay of the imported rigs.

Hmmm..... I don't know about this. A 12V series regulator with a nominal 12V input is not going to work too well. It might not even run the HT receiver if you turn the engine off. Maybe a 7808 would be a better choice and then you most likely wouldn't exceed the 1A limit of the requlator on transmit. Most HT's come with 7.2V batteries now anyway. In the past I've had great success with two or three 5A silicon diodes in series with the power lead to get the voltage down to about 12V. You can add a fuse and transient protection if you like.

Well, you had to know this was coming...

Alinco DR570 dual band, bought about 3 years ago. ZERO problems with the radio itself, which is installed in my truck. It's in a spot where the heat from the heater cooks it some, so every morning and evening these days it gets temp cycled from 10-20F to maybe 80-90F. It's been this way since I bought it. I've been inside the radio to do the so-called mod, and it's all nice clean surface mount in there. I didn't see any poor quality construction to speak of.

Now the mic is another story. Cheap piece of plastic junk. I've had to chop off both ends of the mic cord and re-wire due to intermittant failures. I guess someone at the factory yanks the crap out of the mike cords and breaks the wires inside. The hanger thingy on the back of the mic fell off, because they were too cheap to put a lockwasher, or a dot of locktite, on the screw.

The one imported brand I've seen and heard of many failures from is NOT Alinco.

I strongly disagree with you on your opinion on Alinco.
I have owned an Alinco DJ580T HT for over two years now. I take
it everywhere with me. I have never had a problem with it, and
find it to be an excellent radio. It is one of the most intermod
resistant radios around. I have never picked up pager
interference on it, like some of my other radios. It also has
excellent rich sounding audio. It also included features that you
must purchase separately on other radios (CTCSS decode ect).

Anton,
Enjoy your Icom IC-706, the Yellow wire mod to the
switch bank mod is very good!
As far a a VHF tx mod, there is No mod, Info from Icom
said that Icom locked this out from their CPU. I would get
a marine radio for that purpose. Have a Happpy Holiday
and enjoy your IC-706.
All the mods you did are the only ones that work!!

Source record: 208462

I assume no responsibility for this information.
Modifying your radio involves risk and will void your warranty.
Modification involves desoldering two microscopic joints.
Transmitting outside the bands is ILLEGAL
This modification clears all memory from your radio. SEE BOTTOM.

I have modified my radio to recieve from 60 to 999 mhz. It will also transmit
through much of this area, but doing so is illegal!!!

Instructions:

Remove battery.
Remove 6 screws holding bottom cover.
Remove battery latch.
Loosen 4 screws holding outer case together.
Remove lower cover.
Unfasten ribbon cable and secure with tape.

There are three joints soldered on jumpers. You will remove the bottom two.
Desolder lower two jumpers from jumper pad located just above where
ribbon cable attaches.
Leave upper jumper intact: Probably for European models.
Reconnect ribbon cable.
Re-assemble radio.

Hold down UP and DOWN Volume and CALL buttons while pressing power.

The display will read "BAND 1"

Hold FM key down until F key blinks.
Press BAND key several times until it reads "BAND 7"
Press FM key again. It will stop blinking.
Press CALL button.
Radio will shut off.

Modification is now complete!

You must now program your radio again. I suggest using R-T systems
software to keep the old frequencies.

If you use the software you will need a template for band 7.
Before the modification, upload all frequencies to a file.
After modification load the empty radio to a file and name BAND7.
Now open your old file.
Choose "USE TEMPLATE" and choose BAND7
Send the date to the radio as usual.

6019. FT-530 NI-MH battery pack

To all regarding the IF-232 & IF10B combo for the TS940's: The IF-232 box is an easy to do homebrew line/level converter.
This can be a good evening or weekend project, using a single chip. The most chellenging part is the mechanics of mounting
connectors and a pot! I think most anyone can save a hundred bucks rolling your own!

The IF10B is a different story! It's not that the IF10 does any magic that can't be handled by most handy hams with a data book
and soldering iron - its the fact that this option is a small PCB asnd a NEW EPROM that is required to get the proper information
out of the radio so it may be controlled via the computers RS232 port. The IF10B has been a ore point with many for two reasons;
1 - its a handful of simple parts (8251,7404,4040 ic's,) and 2 - Kenwood never expected many to want to control this rig via cpu!
This unit was designed about the same time computers were 'growing up' and while the control was possible, no one expected
cpu's to be used in the shack like they are.

Don't forget that you'll also need software once you gain rig control! Check the shareware and QRZ cd's - lots of stuff available.

Enough history - I've just been getting email requests for info and thought if it were posted others might save their mailings.

If you need a IF10B and can't find one on the swap nets, etc, email me - I have a few available. For the RS232 box, see August(?)
1993 QST for an excellent detailed article about building your own for any of the major radio brands going.

MERRY CHRISTMAS TO ALL WB9IQI PATRICK

6022. Re: IC-706 Filters

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-22 00:00:00 UTC
From: aust@gandalf.sp.TRw.COM
Message-ID: <9512221950.AA09959@shelob>
Source record: 208466

Mike,
I've complained enough about the rotten intermod performance of my
IC-706 that it is back at ICOM-USA. They keep repeating that I am the
ONLY person who has complained about this problem.
The technician phoned yesterday to say that his measurements showed my
unit to be well within sensitivity spec. He also suggested that I engage
the preamp for better FM BC performance! He clearly hadn't read (or
understood) my letter taped to the box. Their engineer is out until
Tuesday, and HE understands my complaint.

With that as background to the tech's understanding, now to the filters.
The technician insisted that the same filters were used all the way from
60 to 200 MHz. I doubt it. He knew of the cut-the-wire mod to improve
high-VHF sensitivity, but implied that it increased intermod problems.
You do know that ICOM will send you a diagram if you ask, I'm waiting for
mine. The tech said that ICOM-USA just received the diagram very recently
themselves. The tech also said that the first IF of 69-70 MHz IF is so
broad that it doesn't need retuning for the two freqs; the reason for the
intermod at the second mixer.

73 de Bob w3otc
Bob,
I think your right, this receiver is a double down conversion,
when the first RF to IF downconversion takes place, the 1st LO
LO to IF isolation is about 20dB, this LO leakage, along with the
desired IF drive the next IF amp into saturation, allowing the FM BC
to fall in as a higher order image into the 2nd mixer.
Note that when lisenting below 129MHz, if you switch the preamp light off
to black, you reduce the total RF to IF gain at this point, bring the
receiver IF out of saturation. Note no change in receiver sensitivity, but
a big reduction in the IM products(images) that fold in from BC FM.
After you do the yellow wire mod, connect it to VCO switch bank, when using
the 118-129, switch the preamp light from green to black, then you won't
saturate the IF.
Just because the S-meter is jumping up and down, does not mean the receiver is more
sensitive at your desired receive Freq, it means more IM products(mixes),
images can fold into the istIf to then fold into the 2nd IF of the radio.
They should have had a sharper 1st IF filter to prevent LO from overdriving
the RF to IF chain from that point. Really would attenuate the 1st LO leakage
in the 1st IF at 69-70Mhz.
For right now green to black(RF to IF gain) from an operational standpoint
in the 118-129Mhz. I would have designed a sharper 1st If filter, since
I design alot of radio's where I work.
73
Mike

Bob,
Your right on a narrowe 1st IF Filter would do it.
I amazed they did not get the narrower filter from Murata!!!

Mike,

I've been collecting the various mod posts from the ham-equip group, so
am aware of them.

My second letter to ICOM-USA said that I thought that most of the
IC-706's problems were designed in, but was willing to give them a chance
to improve things. Clearly the tech who talked to me on the phone is WAY
over his head. Tom Snellings, their main engineering fellow, probably
understands more, but won't be back until Tuesday. I won't be back until
about Friday.

I see the main causes of my problems as follows:
> 70.8 MHz channel 4 color subcarrier gets into the 70.7 MHz WBFM
first IF and into the WIDE FM BC second IF.
> Many local FM BC stations differ in frequency by 10.4 11.0, and not
so local by 10.6 and 10.8 MHz. It seems that all these pairs get through
the VERY WIDE 70 MHz first IF to mix in the second mixer and be heard
everywhere in the FM BC band.
> Two pairs of one local, one "about 1 mV", FM stations differ by 9.0
MHz, exactly the narrow-band first IF.
> The WB FM 10.7 MHz IF bandwidth is something like 500 kHz with very
wide skirts. Couldn't ICOM afford $1 Murata ceramic filters?
The yellow-wire mod would, as you say, seem to help the higher VHF
frequencies. I don't see a filter-bank mod helping the FM BC intermod.

I would recommend your effort to be the simpler(?) one of narrowing up
the first IF to no more than 200 kHz wide and tune it to 69 or 70.7,
depending on the mode. This would greatly relieve the intermod stress on
the second mixer. A brute force tracking antenna filter might be nice,
but I suspect that simpler actions could greatly improve things.
I'd also guess that the injection to the second mixer may be marginal,
hurting its overload characteristics. Since they double the first
injection osc for the upper parts of the band, one might guess its level
to be marginal as well.

The IC-7000 was no great shakes as an FM BC receiver either.

Tnx for your comments,
bob w3otc

6024. Re: TS850 slope tune with CW filter

Source record: 208468

From: krisn3rqt@aol.com (Kris N3RQT)
Date: 18 Dec 1995 22:12:58 -0500

When I added the YK-88C-1 500Hz CW filter to my TS850 the slope tune no longer behaves properly. The high cut cuts way too much and the low cut is completely ineffective.

Is this normal behavior? Is the slope tune supposed to be useful for CW when optional filters are in place?

The YK-88C-1 is for center frequency 8830KHz (1st IF). This is currently the only optional filter in the rig.

TNX.

This is completely normal behavior. Slope tune works by adjusting the local-oscillator frequencies, in effect shifting the IF center frequencies. Since the IF filter does not change, this has the effect of shifting the IF passband. When you have two IF filters in line, the overall effect is that the intersection of the two passbands is the total passband for the receiver. As you shift the filters more and more, the total passband is reduced until it there is no intersection.

The individual slope-tune controls each shift a different IF passband. Thus, if you put one CW filter in, then the slope-tune control corresponding to that IF will change, while the other control will remain the same as before. If you put both CW filters in, then both slope-tune controls will change.

Source record: 208469

On the subject of intermod problems with the IC-706, here's a strange problem I've experienced with mine. When listening to 75m SSB one afternoon (nighttime listening to 75m SSB takes a stronger stomach than I have), I heard a strong S9 pattern of distorted audio that seemed to be coming in on an IF frequency (i.e., it was all over the band). The signal was somewhat weaker on 40 meters and had nearly disappeared on 20 meters. Eventually I traced it down to an A.M. broadcast station at 1220KHz. The signal was so distorted it took me a while to figure out where it was coming from. I finally identified the station when I switched the 706 into the W-FM mode, which inexplicably cleaned up the signal enough to make it intelligible! My FT1000D showed no interference at all.

Normally, I use an antenna tuner on 75 meters, but on that afternoon I didn't bother. Switching in the tuner eliminated the problem, presumably because of the additional selectivity it provided. Switching in the 20db attenuator also cleaned up the problem. With the 20db preamp on the radio was unusable. In any case, the 706 seems extremely sensitive to BC band overload, and somehow the wideband fm demodulator detects the am signal. My 706 has the "yellow wire" mod, though I doubt that affects the hf performance.

Reguarding the 70Mhz IF filters for the 1st IF
Toko America Inc ., has some real great 70MHz 1st IF
filters which I have ordered to play with in my IC-706.
the Toko 7KLT Triple Tuned filters can be configured as
High pass, Low pass , or bandpass over frequencies
10-150MHz.
Another 70MHZ filter is the 5CCEW and 5CCET from Toko, but
they are 15MHz BW, which are too wide!!
If anyone knows of any other <0.5MHz BW filters at 70MHz,
let us know here on the newsgroup.
I hope your starting to get the idea now, whats next!!
Some of these are only 400KHz wide and can be tuned, modified
to 70MHz for the narrower BW than their typical 20MHz wide 70MHz
filter!!
Well that's my plan so far, we will keep you informed, but I think
this will take care of all the FM BC problems!!

Receiver Front-End Filtering, 60 - 200 MHz

The IC-706's receiver front-end filtering above 60 MHz is rather simple. Coming in from the antenna there's a low-pass filter, which's shared by the transmit signal path (I've done no calculations yet on that filter). After that we come to the following two possibilities.

When the radio is operating on the 2 Meter Band (144 - 148 in the U.S.) a bandpass filter is in-line. It consists of a two singly-tuned transformers, with a 0.79 pF coupling capacitor between them. (Can there really be that small a capacitor? Sounds more like 'stray' coupling than a discrete component, but the schematic shows it as an actual part) The schematic provides no tuning or alignment data, so I must assume that ICOM has the coupling capacitor, and transformer tuning, set for slight over-coupling, to produce a somewhat 'flat-topped' response across the 2 Meter Band.

ANYWHERE OUTSIDE THE 2 METER BAND (this only applies above 60 MHz of course), and the 'filtering' consists of a low-pass/high-pass filter combination. I'm certainly not a 'modern filter' design theorist. I can figure basic Poles & Zeros, but not much beyond that.

Several people have reported the IC-706's receiver sensitivity dropping-off rather abruptly up around 165 MHz. When I squinted really hard at the schematic (6's and 8's tend to blur together), and 'punched some numbers' into my little calculator, here are some of the figures that I got:

Coming in from the antenna, the receive signal hits a parallel LC pair (82 nH & 12 pF); I figure there's a Pole at 160.44 MHz. There are also 20 pF cap's, on either side of this section, going to ground, but I don't know how to 'handle' them. (Yea, I know it's some sort of Cauer/elliptic filter, but that's all)

Next the signal goes to a parallel LC section of 68 nH and 20 pF, that I believe produces a Pole at 136.47 MHz. There's either a 10 or an 18 pF capacitor on the output (leaving this LC section), but the schematic's too blurry to make out which.

Now the signal hits the high-pass filter section. In series there are capacitors of 24, 22 and 27 pF. Between the 24 and 22 pF caps

is a series LC circuit to ground of 220 pF and 0.15 uH, although the inductor's figure is very hard to read. My calculator tells me that series resonance (a Zero) should occur at 27.71 MHz. Then, between the 22 and 27 pF capacitors, there's a series LC of 82 pF and 0.18 uH, which should produce a Zero at 41.43 MHz.

Logically, the result of this low-pass/high-pass filter would seem to be a response that falls off rather quickly somewhere a bit above 41 MHz (the upper of the Zeros in the high-pass section) as you move down in frequency, and somewhat below 136 MHz (the lower of the Poles in the low-pass section) as you go up in frequency.

Once the receive signal gets through either the 2 Meter bandpass filter, or the 'everywhere-else' low-pass/high-pass filters, it goes to a preamp, followed by a low-pass filter (I haven't tried to work-out its characteristics yet). It appears that it's right at that preamp that the 60 - 200 MHz receive signals 'meet-up' with the signal flow that's followed by the HF and 6 Meter signals. Those signals have gotten to the preamp via a completely different path, but I won't cover that now.

Some Very Simple Synthesizer Comments

The "yellow wire" modification, much talked-about, seems to have an 'advanced-option', where some brave persons have managed to pick-up a control voltage on a tiny surface-mount transistor on the synthesizer board. In the discussions on this subject, it appears that there is a misconception about what that transistor does.

The IC-706's synthesizer uses (among other things) two VCO's. The two VCO's can have either their direct output used, or there is also a frequency doubler circuit available. "VCO 0" (zero) is used on its fundamental up to 29.999999 MHz. At 30.000000 MHz "VCO 1" takes over, and is used up to 59.999999 MHz. At 60.000000 MHz, "VCO 0" takes over again, but goes through the doubler circuit. "VCO 0", with its frequency doubled, works up to 128.999999 MHz. At 130.000000 MHz, "VCO 1" takes over again, this time with its frequency doubled, and that's what's used up to the 200.000000 MHz upper-frequency limit of the IC-706.

Now, the output of these VCO's, either the fundamentals, or the first harmonic (2 X fundamental), go through a bank of filters (the IC-706 is 'oozing filters'; they're all over the place). Between 0.03 MHz and 29.999999 MHz, a low-pass filter is used. Between 30.000000 and 59.999999 MHz, another low-pass filter cuts-in. Between 60.000 and 128.999999 MHz a high-pass/low-pass filter pair is used. Between 129.0000 and 143.999999 MHz ...AND BETWEEN 148.000001 and 200.00 MHz another high-pass/low-pass filter combination is used. BETWEEN 144.000000 and 148.000000 MHz, a separate band-pass/low-pass filter set-up is used.

It is because of this mixture of synthesizer output filters that people have been able to find that transistor, to hook the famous "yellow wire" to. That transistor is one of several, that switch the appropriate synthesizer output filters in-and-out of the circuit.

- End Of Discussion -

Yes that's the question that some of us have been adressing. I think that a membership journal does not publish an ad including the construction manual for a kit for a commercial enterprise. I think that the authors are fine fellows, and that the ARRL is a fine organization, but you put your finger on it.....you are running a magazine.

Anyone know the story behind the R-725.

It is basically a R-390A with the IF deck from a 390, and an extra oven on the PTO.

These were sold by Arvin and Servo to the military for DF work.

Anyone know the technical reasons behind these modifications? Why not just use the R-390A?

Thanks,
Tom N5OFF@aol.com

6037. FT-980 CAT PROGRAM

Date: 1995-12-22 00:00:00 UTC
From: bmitchel@kodaki.kodak.com
Message-ID: <4bf4ai$ig8@kodak.rdcs.Kodak.COM>
Source record: 208481

Hi all, I have an FT-980, and I have the k5yef program, but
can't seem to get it to work. I made the interface, and rx data and
tx data are going both ways, and appropriate levels. It put's the
transceiver in external mode, then it craps out.

Any ideas? Any programs with source code?

73 Brad WB8YGG
P.S. e-mail any responses to bmitchel@kodak.com
Alos, I have full ftp , modems etc if you know
of a site that has a program. Thanks, Brad WB8YGG
.

We have an R7000 with same problem. Icom blames a capacitor in the invertor that drives the VFD. (vacuum flourescent display) check that first. Let me know what you find. I would like to know before I open ours up.

Source record: 208484

This is NOT A FLAME. I am prompted to follow-up because of the underlined portion the response from dtburr@mcs.com. Just food for thought.

Rick Tressler <RT0@GANET.NET> writes:
>I did some basic investigation into the fesibility of using a DSP with
>my old FT-101E. After talking to numerous folk regarding the
>effectiveness and cost comparison, I decided to upgrade the radio,
>rather than dump a lot of money into an audio filter, which is
>basically what these devices amount to. If you have a rig with a
>crummy IF stage, a DSP may not necessarily fix your needs where a
>true front end filtering system will, in many cases. Food for
>thought, anyway.

dtburr@mcs.com replies:
>Wow...who on earth would talk you into that? Spending a bunch of money
>on a radio that's obsolete seven times over and will never compete
>with state-of-the-art rigs in receiver quality or in any other way,
^^^^^^^^^^^^^^^^
>rather than spending *less* money on a today's-technology DSP that can
>be used on the new radio when you upgrade? Any investment you make in
>filtering for that old boat anchor will never be recovered.
>
>To each his own, I guess. I'll bet a lot of telemarketing folks would
>kill for your telephone number.

I feel that I HAVE to reply to this one as I am the one in the process of buying Rick's FT101E :)

First of all, according to Rick's own post, nobody was trying to talk him into buying ANYTHING. He was just getting advice. Telemarketers might not want Rick's telephone number simply because he gave a bit of thought to the idea of buying a DSP to upgrade an existing radio before making a decision. Telemarketers want sheep. Also different people put different values to the same thing. I might think of a diamond as a waste of good coal but others value it highly. To each his own.

Ham radio is a VERY wide field with room for a lot of interests. Some people are interested in old boat anchors and other people are not. Some people are interested in tweaking the maximum performance out of old boat anchors while others are interested in the latest rigs with all the latest bells and whistles. Money isn't always the sole criterion.

For me, the 101E has a lot of features I prefer in a rig. I like to maintain my rigs myself. The 101 series has no proprietary parts that I can find. If I blow anything, I can usually go to Radio Shack and buy a replacement part. The 101 uses older technology and larger components that I can get at without reaching for my microscope. Can anyone say that about any rig currently out on the market?

Also, the 101 is no longer the hottest thing on the market and no longer commands a premium price. I can experiment and try out my ideas about "improving" the design without worrying about toasting my $5000 rig. If I toast it, I can easily purchase another one at a reasonable price. Isn't experimentation part of what ham radio is all about?

Personally, I might just try to add DSP to the 101. I may want to try adding it at the IF level. The 101 has separate boards for everything. It might just be sufficiently interesting to take out the noise blanker and try to cobble out something using modern technology that can do the job better. Maybe I will never get around to trying it. Maybe I will fail. Maybe I will toast the rig with a faulty design. For me, such an idea might just be sufficiently interesting to give it a whirl.

Yes, I may eventually sell the 101 I am buying from Rick and the 101E is obsolete seven times over. I may find a hybrid rig that performs better than the 101 (any ideas on this?) but I will probably always keep an obsolete hybrid around. Tube finals which are MUCH more forgiving than MODERN transistors. This has benefits which I am interested in. Tube finals are a lot cheaper than transistor finals. Unfortunately, they don't tend to last as long if 50 ohm loads are assumed but are much more flexible on loading up on anything available [like lightbulbs!]. Between the inexpensive nature of such rigs and the flexibility in matching antennas, I think that hybrids are very useful during field day. If I toast the 101 during a freak shower, I can try to fix it but I certainly won't have to cry over losing a multi-thousand dollar investment.

Finally, the 101 has specific features that I enjoy. It has a dual power supply built in so I can power my rig on basically any power source available: AC or DC. If I recall correctly, I might also be able to wire up a power plug to choose between 220AC and 110AC. [I have never had an excuse to take advantage of this so I am not sure.] Can any modern rig boast of this?

I will probably end up buying a solid state rig one of these days but unfortunately it will probably have to be yet another obsolete rig. [Maybe the TenTech Corsair II?] I am not interested in a rice box that is not maintainable by the end user. I want a rig I can maintain myself. A good service manual is essential. I don't want to be tied down to a single source supplier so no proprietary components allowed. Even if an off-the-shelf component is discontinued, I stand a fighting chance of locating new component from existing stock but if Kenwood/Yaesu/Icom runs out of their proprietary IC, the show is over

if I can't find a dead rig to cannibalize. Can any modern rigs boast of this? Unless I am mistaken, even the much vaunted TenTec contains proprietary EPROMS.

I may sacrifice a bit of the latest receiver performance but I think I gain quite a bit from a boat anchor that is obsolete seven times over. Remember CW is also obsolete seven times over but a lot of folks derive a lot of joy from it.

In this post I have written quite a bit about the kind of HF rig I want. Advice on other rigs which fill my requirements is appreciated.

Incidentally, I had to reformat the post before following up on it. Please try to keep 72 character lines as per Nettiquette.

Well this is what I really don't understand. I have seen this attitude many times over the last few years and am totally baffled by it. Why is the ability to write software held in such high reguard while the ability to design a reciever is so simple its not worth protecting. I mean it takes a great amount of skill to just write an article for this type of journel, that is readable and understandable by the masses. Now if one goes to all the time and trouble to create an article that can make the diffucult easy then maybe it should be presented in an encoded format so that others can't learn from its publication. I know you will say silly example but whats the real difference?

Back when logic was a black art some would use a simple 7400 in a kit and then scratch off the part numbers. This was to protect thier investment of time and work in "Creating this circuit". However QST would never have considered this type of kit for a construction article. And I really can't see the difference between the two. This makes at least two major articles of this type in the last few months. Actually I fear that its more an indication of what the staff thinks of the average amature's skills than anything else. Or maybe too many of them have no understanding of controllers, and don't really understand the handicap they are putting on some of the membership.

It was a great article but if you were going to modiy it wouldn't a phase detector be in order? And one would sure have to say the kit price is reasonable. One thing for sure the author isn't trying to get rich off of it.

One other thing; how many of you have went back 10 years and pulled a construction article? I know I have and I doubt the part will be available from the author 10 years from now.

6044. Problem with Yaesu FT-51R

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-22 00:00:00 UTC
From: ctbaker@burrito.engr.ucdavis.edu
Message-ID: <4bdncd$t3s@mark.ucdavis.edu>
Source record: 208488

I just got my 51R back from Yaesu after they performed the 15 kHz upgrade and tried to hook it up to a power supply and ran into a problem. I have the left bank set top 2m and the right bank to 70cm and both VFOs are set to A (though the problem exists no matter what VFOs are used). I am using the Yaesu DC Adapter/Charger model E-DC-12 and a Diawa PS-50TM power supply and interfacing the two using the cigarette plug in the power supply. I am using the FNB-38 battery to power the Yaesu. When I transmit on the 2m band I get interference coming across on the 70 cm band and the voltage drops on the power supply. I do not have any problem transmitting on the 70 cm band. When I run the radio just using the battery instead of the battery, power supply, adapter combination I do not have any problems.

Any ideas?

Thanks

Chad / KE6ZTC

6045. Mods for Uniden/Bearcat 50XL ?

Newsgroup: rec.radio.amateur.equipment

> 73, doug
>

The question still remains...Why is the source code not being made
available ? The ARRL normally requests that project code not be
witheld as proprietary. They can make it available through their
BBS, FTP or WWW site if it cannot be accomodated in the article.

Sure, another micro could be retrofitted but why bother when you can
drop in the proper part ? I have access to HC11's and a programmer
so why shouldn't I have the option to do it myself ? Furthermore, I
might want to use the existing code and make improvements or changes
that accomodate my own needs.

The only reason I could imagine the author witholding the source code
is for personal gain. I appreciate that he may have spent hours
developing it and wants to be rewarded for his efforts however that
would turn this project into a business endeavor, not a hobbiest
offering like I thought it was supposed to be.

I hope the ARRL continues to stress the importance of supplying source
code with computerized projects that appear in their publications.
Just my opinion.

6056. Circuits vs Code?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-23 00:00:00 UTC
From: little@pecan.enet.dec.com
Message-ID: <4bha6f$5d8@usenet.pa.dec.com>
Source record: 208310

Given the latest flap or debate about source code in QST construction articles, I'd like to hear a logical argument for keeping source code private. Several of us have asked and I've yet to hear a good explanation of how code differs from a circuit design? Would QST consider publishing a construction article that contained a black box, only available from the author (even if at minimal cost), that was the major part of the project? The effort and skills that go into a good circuit design are at least the same or greater than that which go into implementing some program. Yet I can find volumes and volumes of circuit designs applicable to and developed by amateurs. In the area of software, the pickings are mighty slim. How many satellite tracking programs are there out there? Yet the only sources I think I've seen are for the N3EMO sources for an extremely rudimentary tracking program.

Personally as a software developer I believe this is stiffling amateur advances in many areas as more and more things become software based instead of hardware based. If this trend continues, the sharing of ideas and learning from others that have been a hallmark of this service will suffer.

So again, why the difference in view between circuit design and source code?

Zack Lau <zlau@arrl.org> wrote:

> (As an aside, nobody has suggested we stop
> publishing such projects because there
> is no second source for 3CX800s)

That's very close to my point. The ARRL has to make a decision in publishing articles such as this as to the depth of proprietary disclosure and resources. That's true in any construction project. The question is, should you refuse to publish an article because an author witholds certain information? There are characteristics of the manufacturing process that no manufacturer will disclose, but that doesn't necessarily preempt their product from being utilized in a construction article. To my mind, this situation is no different. The author has a right to protect certain aspects of his work, but that doesn't automatically render his project useless to the builder.

> 2) You can take the author's ideas and design an even
> better version. You ought to have a huge advantage
> because the author has often done the hard work--making
> the first working unit. Ever notice how textbooks often
> have exercises to work out on you own?

In this case, the author isn't being asked just to disclose the hard work, he's being asked to disclose *all* the work. That isn't necessary in order for the builder to accomplish what you suggest, nor is it a prerequisite to the learning process.

> 3) You can study the schematics and run calculations/simulations.
> What components have to be held to high tolerances?

Sorry, I just don't buy the concept that every detail of the project has to be included in order to do this, or that the author should be enslaved to that goal. I certainly disagree with the notion that an author who refuses to comply should have his material summarily dismissed, especially if there are otherwise redeeming qualities to the article.

I don't speak in favor of the ARRL very often, simply because past policies were often contrary to my best interests. For the same reason, I have never been a member. Nevertheless, this is one instance where the League has used good judgement. I hope the editors will continue to publish useful articles without binding the authors to a rigid policy of full disclosure.

I've heard nothing but good about Ten Tec until now. Earlier today, I worked a guy who said he owned a Paragon for several years. He went on to say that the rig was really superb when it worked, and that Ten Tec fixed it at no charge whenever it broke, but that it broke often and was a nuisance. He also questioned whether the price of these rigs is inflated because of their policy of free repairs, and the frequency at which those repairs are needed.

As a final note, he said he opened it up once and was of the opinion that the individual components were cheap, and that the (single-sided) PC boards looked like they were etched in someone's basement. In short, he claimed these rigs have terrific circuitry design, but the worst implementation he has ever seen.

I'm mentioning this because I've already recommended Ten Tec to a friend who recently came back to the hobby after a long absence. My recommendation was based on the many satisfied users I've heard from, both here and on the air.

Can anyone verify whether the above commentary on these rigs is accurate?

The difference between code and circuitry can be reduced to a single question - will the reader be prevented from completing the project? If the missing ingredient is source code, the answer is "no", even though completion may require significant saavy on the reader's part. However, if the missing component is a "black box", the answer is "yes", because there is no systematic method by which the reader can construct the device.

>The effort and skills that go into a good circuit design are at
>least the same or greater than that which go into implementing
>some program. Yet I can find volumes and volumes of circuit designs
>applicable to and developed by amateurs. In the area of software,
>the pickings are mighty slim.

If you examine both the origin and the inherent characteristics of each, you will see that this is the natural state for these two resources as they relate to Amateur Radio.

New circuitry, at least complex circuitry, is nearly always designed for industry at a profit. Once that profit is taken, or at least the use of the circuitry assured, the Amateur community (which does not compete with the originator) benefits from the publication and use of the technology. Further, the technology is generally transferable to Amateur use with little or no modification.

As you say, it also takes considerable effort and skill to write software. And like hardware, it is usually designed for industry for profit. Unlike hardware though, it is not readily transportable to Amateur use. For instance, a complex program designed to guide a robotic arm that assembles VCR's isn't likely to find much use, as-is, in our work. Sure, bits and pieces may be useful as subroutines, but that still means considerable work is involved in completing a working program. Industry isn't paying for it this time though, so a version suitable for our hobby is never written.

>Personally as a software developer I believe this is stiffling amateur
>advances in many areas as more and more things become software
>based instead of hardware based. If this trend continues, the sharing
>of ideas and learning from others that have been a hallmark of this
>service will suffer.

You're right, and I think it's inevitable unless someone either pays industrial rates for the information published in QST, or forces the industries we support to provide it. After all, look at where Amateur technical articles and advances have traditionally come from. If you go back to the 40's, 50's and 60's, you find that many contributors were employees of Amateur equipment manufacturers, and that those manufacturers considered it good press to have those articles published. Sure, they knew some hams would build their own, but they also knew that the majority would come to them to buy the product.

Now, look at the situation today. The manufacturers produce equipment and designs that one in a thousand couldn't duplicate. And, whether they publish articles about circuitry advances or not, hams will buy their products. In fact, they've learned that they have a captive audience, and that the majoriy of hams don't care.

I don't have a solution to all this, but I do know that complaining about the technology we *don't* receive is like telling the FCC that it's inconvenient traversing such large amounts of free spectrum. If the ARRL as a matter of policy refuses to publish any article that doesn't contain source code, we will lose not only the code, but the circuitry as well.

BTW, aren't these Code - No Code threads supposed to be posted on R.R.A.Policy? :)

I am seriously considering buying an Omni VI myself and I would like to know if the rigs are up to snuff. I currently have a Icom 728 and I know that the Ten Tec rigs blow this toy out of the water. I work primarily CW, 99% of the time. I am only a Tech+ and I am working on the upgrade to at least an Advanced license. I have heard rave reviews of the Ten Tec Omni VI and several of the local hams who at one time or currently are world class contester say that it is a great rig for certain characteristics, QSK and selectivity, sensitivity can be matched and better by the Yaesu and Kenwood big rigs. However, QSK is unmatched and the mixed crystal receiver provide terrific selectivity.

I would like to hear from you and any others who operate an Omni VI as to whether or not these impressions are true or not.

This does not reflect what I see inside my OMNI VI, which has
been flawless in operation and 100% reliable. I note also that
you quote someone who was using a Paragon. I inquired about the
Paragon II which was introduced last year. Are we talking about
the same version of radio. The Paragon II is a hybrid of the
Paragon and OMNI VI.

The statement was made by one of the people involved, on Usenet, that they didn't want a commercial firm to pick up the entire design and sell it without compensation. Sounds like a good reason to me.

Although, if the source code were available, someone might modify the code so all commands came in the serial port of the 6811 instead of contact closures and status could go back out the same way, so the whole thing could be done as a peripheral to a PC or Mac.

>Ham manufacturers do radio DSP by using a very very low IF. So low it's
>almost at audio. So it's almost exactly like audio DSP anyway!!!!

This brings an interesting point. How far should one go in hacking an old rig? Personally, I own the rig not because of its resale value. I don't figure on ever selling it. Yes, I am a major packrat. I figure that if I ever get rid of it, it will because I have toasted the rig so badly that I can't even salvage parts. At that point, I'll buy another one and start all over.

The high price of DSP chips is a case in point. In order to add it, I will be spending MORE on the enhancement than the actual worth of the rig. Does it bother me all that much? Not really. I figure that I run a higher risk of toasting the DSP chip while experimenting than actually enhancing the rig's performance. But what the heck! I consider it a pretty neat hack and worth while doing all by itself. The trick however, is to choose a project that is sufficiently difficult that you end up learning something useful but not so difficult that you give it all up entirely.

As someone who is building single units and not mass producing anything, cost effective manufacturing is not a factor. I can try things that any sane manufacturer would never try if they are interested in staying in business. I don't have to worry about the marketability and pricing of the unit. Profitability is not an issue. My benefit from playing with the rig is the hack itself.

Personally, I think more hams should try picking up a soldering iron. So what if you get burned once in awhile from the soldering iron because you are extra clumsy or if you decide to build something that toasts your equipment? The aim of the game is to try to do something that you could do before or thought that you can never do. Who knows, you might surprise yourself! But then, to each his own. Different folks for different strokes.

P.S. A great starter project for those who are inclined is the CMOS Super Keyer. While I haven't personally seen version III, version II is very easy to build. From the article in QST in August, none of the changes made in version III would make it

any harder to build. You end up with a useful unit with only an afternoon's work. There is nothing so tight that it is difficult to solder. The problem with the keyer is that once you build the kit, you might actually become tempted to become proficient at CW.

Try it, Mikey, you might like it.

Another problem with the kit is that source code is not available for version III but that is another thread entirely :) Does anyone have the code to version II lying around? I have been meaning to ask for it.

^^^^^^^^^^^^^^^^???
>picture of schematic to see clearly and install a jumper froM IC32 pin
>11 to the point where you cut the trace. This will restore transmit
>from 135 to 175 MHZ.

I was looking at the information given in this mod and comparing it to the schematic. This mod seems to be legit. The jumper labeled W4 on
the schematic appears to be the green 0 ohm resistor just to the rear of D59. In the USA version removing D60 and removing W4 would be the
same thing.
I believe that removing D60 just prevents the radio from tx on aircraft band after the VHF mod is performed. Removing Q38 or R353 would have
the same effect as cutting the yellow wire (J4). The receiver would work better if the yellow wire is rerouted to the VCO switching
transistor. So all that is left is pin 11 of IC32. This pin is the same as the orange wire next to the famous yellow wire. All this wire
does is supply 5 Volts whenever the radio is outside the 0-60MHz range. This wire labeled L8 on the schematic is the one responsible for
enableing the 2 meter bandpass filters that are located in the PA unit. It also disables the high power amplifier which consists of a pair
of MRF 255 and is used in the HF and 6 meter bands. It appears to me that all that is preventing the radio from txing outside the 144-148
range is a control pin. The PA unit appears to be fully enabled in the range 118-174. The control pin that disables the out of band TX must
be acting on one of the pre driver stages maybe IC1 or IC38. Now if we could find this missing information about the control pin, all that
would be necessary would be to rewire it to the orange wire. This would enable it in all the range 118-174 MHz.

On the receive side, it appears like the 60MHzHP/129MHzLP filter that is selected for receive anywhere outside the ham 2 meter band used to
be a (60-200) filter. This would explain why this filter would have been selected the way it is in the unmodified version.

Now that I got a copy of the schematic I am making a list of things that I'm going to change to the radio. I just wished that Icom would
have engineered the radio a little better. Although the radio is an outstanding attempt at

a tribander all-mode radio, it could have been a
lot better.

How is the code any different from the black box? Without the code,
one either has to rely on the creator of the code to provide it
in non-human readable form, i.e., binary image, or re-invent the
wheel. The first case is no different than having to get an epoxied
circuit from the creator. The second case is also like the black
box, i.e., you know what it's supposed to do, now go figure it out
yourself. Seems like that runs counter to the purpose of publishing
construction articles, unless their real purpose is just to prove
that it can be done. My impression though was that they are meant
to be reproducible by the average amateur and usable as a basis
for further experimentation. I certainly know that I've learned a lot
about simple transciever design from Roy Lewallen's and Zack
Lau's published designs. If major portions of their circuits were only
available as embedded in epoxy modules, with only a description
of what they do, not how they did it, would I have learned as much?

Software code without source *is* a black box by definition. You are
only told what goes into and out of the box and what the box is
supposed to do. You aren't given any knowledge about the inner
workings of the box. That's the definition of a "black box" in most
design lingo I've ever encountered.

But that isn't the source of most amateur construction articles that
I've seen in QST. The articles in QST are at such a primative level
that few manufacturers would even consider them. There is nothing
wrong with that, but I don't buy the argument that commercial
designs filter down to be discovered by the amateur. As you said,
the commercial designs tend to be far to complex for the average
amateur to deal with. The software we're talking about here is not
in that league, i.e., too complex to be usable to the average amateur.

> As you say, it also takes considerable effort and skill to write

> time though, so a version suitable for our hobby is never written.

This only true in certain cases and only because the software industry
currently allows it. In any case, since I don't believe circuit designs
percolate down from industry to amateur tinkerer, I likewise don't
believe that software designs would also do that. Also, simply
because most of the software industry is still treating software
development as a garage shop activity, that doesn't mean the amateur
community needs to do the same. If the ARRL (or any other interested
body such as AMSAT) were to sit down and define the software
building block interfaces (not their implementations), then amateurs
all around the world could contribute in piecemeal fashion. Instead,
little code is shared with the rest of the amateur community, and what
is shared is shareable, i.e., isn't meant to be reused as it has no standard
interfaces. Imagine a large class library of things like orbits, antennas,
terrain models, circuits, etc. It *is* possible to do. Simply look at the GNU
project for an example of how very high quality state of the art software
can be developed primarily by volunteers and available in source form
at no cost.

> BTW, aren't these Code - No Code threads supposed to be posted on
> R.R.A.Policy? :)

Yeah, but I thought I'd follow the example of the few boorish individuals
that continue to post those arguments in r.r.a.misc. ;-)

6081. Re: Alinco Radios Are "Not" Junk

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-23 00:00:00 UTC
From: jls <jls@sierra.net>
Message-ID: <4bi0jj$dro@jobes.sierra.net>
Source record: 208335

I bought a dj580 three years ago and have used it for my HT, my mobile in my car, my street bike motorcycle, my portable packet with a laptop and also carry it around while riding on my dirt bike motorcycle and mountain bike in addition to carrying it around while hiking and rock climbing.

I'd say that this radio has been put to the test and has faired quite well. My wife got her ticket last year and we decided to get another Alinco. My opinion is that they are quite durable and feature packet for the money.

6082. Want: Yaesu FT-102 service manual

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-23 00:00:00 UTC
From: n4ij@aol.com
Message-ID: <4bi73v$hho@newsbf02.news.aol.com>
Source record: 208336

I'm looking for a service manual for the FT-102. Original or a copy. The
owners
manual contains a couple of schematics but omits all of the RF/IF area. A
complete set of schematics would be ok in lieu of a service manual.

It goes away after a month or so. If it's an old radio, you might try spraying windex lightly on the chassis and wiping off. The yellow comes right off and you'll find that the smoke oil has protected the metal underneath.

I need a front panel assembly for a Kenwood TS-440S xcvr part no. A20-2556-03. I know that they aren't made anymore, but going through Kenwood has been a joke in the past. Anyone have an address or idea who might have these parts available, or a mint one from a smoked unit for sale? Please e-mail me with any info....Thanx...

I also had solder problems with my TS-440s, ...the external speaker jack was flaky and probably the hardest point in that radio to re-solder, of course. Also, the rig would sometimes die when switched to the 15 mtr band, which was caused by poor factory alignment on one of the oscillator stages. The problems are getting worse all the time from what I hear from people on the air. Also had bad fan sensor go bad right after I bought the rig new....

I did some FT-980 programming when it first came out. The FT-980 CAT system has an undocumented quirk in that it needs an extra comm cycle to set up it's internal stack when the CAT system is first enabled. I used K5YEF's program many years ago, but I seem to recall that I had to start it twice to get the comms working. See if you can reach K5YEF for his comments.

>shorts on the output.
>***Important! Any questions, please EMAIL me direct: cardenas@kaiwan.com
>Enjoy! Tony Cardenas WA6IGJ

Hey Tony,

Thanks for your article, however, the output is typically 2 volts below the input voltage (per ECG spec sheets), therefore, voltage when the battery is charged (while driving) will be close to 13.8volts and give an output of 11.8 typical. If the engine is stopped, the voltage will be closer to 10 to 10.5 volts. It does not provide "12 volts ... no matter what". Other than that, it is a good way to go. Also, care should be taken with the heat sink as it can get VERY hot.

Someone has posted my private messages to him to the entire World (or at least this group). I certainly DIDN'T intend that my off-hand comments about ICOM America be spread to the entire world. I'd do that myself if I felt it desirable. Please accept my apologies and I certainly hope that this will never happen again.

---------- READ THIS NOTICE ! ---------
I repeat what I have said many times: The IC-706 performs very satisfactorily within ALL the ham bands where I have used it. My complaints concern its performance on other VHF frequencies. Even without this "bonus" coverage (and much can be restored with a simple mod), the IC-706 is an amazing little rig.

Again, I regret that my private comments were broadcast to the world.

Just wanted to mention that Windex brand spray cleaner is *the* stuff to use for this. Do not use other brands of glass cleaner - they're much harsher and can remove the markings on knobs and panels. Even Windex can do this if the paint is badly oxidized, so it's best to test on a panel character or a knob marker that won't be missed too much if it wipes off. Also, don't leave the Windex on the panel any longer than necessary. When you spray it on, it will drip down the panel and you'll see the yellow smoke film dissolving and dripping down with it. Have a rag ready so you can wipe it quickly, before the goop gets into cracks and crevices where it'll never come out.

To get the film off knurled or fluted knobs, use a toothbrush. Spray the Windex directly on the toothbrush, then lightly scrub the knobs. This will get the film as well as dust and dirt out of all the small crevices in the knobs. Don't use too much cleaner for this - the toothbrush should be damp, not soaking wet.

Finally, when you wipe the meter face or other glossy plastic surfaces, use the softest, thickest paper towels you can find. They should be a major brand. Cheap paper towels, especially the thin ones, tend to have coarser fibers that can scratch the surface.

Hi Gary,

There is no special point. Withholding software is exactly like
withholding any important part of the construction article. I fail to see
why software is any different than the actual circuitry or the theory
involved!

I think the action is determined by the goals of the publisher. If the
goal is to encourage subscriber's to build and learn, the publisher will
supply enough written information to complete the project. If the goal is
to support or protect effort the writer made, important data will be
withheld.

I can't image the software for the tuner is very unique. But it may stop
good hardware people from doing the project, or software people from
improving it!

6100. Re: R-725 (R-390A Variant)???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-24 00:00:00 UTC
From: radiomatt@aol.com
Message-ID: <4bjrkq$ie@newsbf02.news.aol.com>
Source record: 208257

The IF deck on the 390 is different than the 390A; it uses tuned circuits instead of mech filters (though one mine has ceramic filters!); and there asre 6 IF amps instead of 4 in the 390A version. (The 390 also has 2 RF amps with 3 tuned circuits in the front end).
Now as to why: If DF work is being done, I suspect the distortion caused by the mech filters could screw up high accuracy DFing; probably because the wave fronts are distorted by being mechancally processed.
I have a RACAL receiver with one front end/tuning apparatus, but with two independent IF and audio sections; I'm told this was for DFing; maybe you're missing the 2nd IF?audio piece?
Sounds like an interesting radio.
I love the 390/390A sets I have 4- 2 of each; for AM DXing (the broadcast band) I find the 390 better (clearer audio).

Hi Craig,

I have been using the FT757GXII for about 7 years now and am finding it
hard to justify getting a new rig.

I use mine with computer control from my logging software and have an
externat voice keyer running... It works great in most of the contest
and in easy to use (not to many buttons). If there is one thing I
find trouble some it the controls on the back that I wish were on the
front (I guess that would add more buttons!). I compaired the spects
with that of the FT990 and the 757 is as good in both rcv and tx.

So enjoy and I hope to work you on 17m.

73 and Merry Christmas,

Dick

When buying New/Used equip from Frank be sure you
perform an operational check on the equip. Be sure
and verify that ALL of the options that he says are
"installed" are actually in the equip in question.

I bought a Icom V68 HT in which he told me the CTCSS
tone board was installed. I took his word as a fellow
ham. To my dismay, I later discovered that NO CTCSS was
installed!!!

When I contacted Frank he was very rude and told me that I
should have known better and that CTCSS was an option, not
standard. I knew that it was an option and specifically
asked if it was installed as the radio was useless to me
without the option. He told me it was installed!!!

Franks told me that If I wanted any refund that would have
meet him in Burnaby BC, a 6hr drive from my location. Not much
of a solution, eh?

So,take this into consideration if you are thinking about making
a purchase from Frank.

FYI -

Sounds like the person reporting this less than pleasant
experience with Austin Amateur Radio was in the minority
of customers doing business with this dealer.Most of these
ham stores employ individuals who are paid
near minimum wages with little or no fringes. As a result,
you may encounter a salesperson who doesn't give a "da_n" because they know
they're just putting in time until something better comes along.
If I received this type of "arrogant, surly" treatment I
would definitely notify the manager who may not be aware
this individual is treating customers this way.If enough
people complain, chances are he won't be there next time
you frequent this store. There are
too many chain ham stores who will gladly take your money
and give you excellent service. Its a buyer's market and
you deserve to be treated with the same respect you would
get as a customer in any other business.

My 2c, from someone who's bought a lot of gear over the
years,
Bob Needleman, KD4ZN

Hi Tom,

Are you sure those goals are mutually exclusive? There are always parts used in a construction project that must be purchased, rather than fabricated. What about an article that builds on a new IC only available from one manufacturer? Isn't it possible that the IC could be homebuilt using discrete components? Why is it reasonable for the IC manufacturer to withold the blueprint of the IC, but software must be disclosed? No offense to anyone, but I don't think this argument is based on furthering the art of Amateur Radio. I think it's based on what some readers percieve to be an unnecessary expense.

>I can't image the software for the tuner is very unique. But it may
>stop good hardware people from doing the project, or software people
>from improving it!

That's really not a fair evaluation. Good hardware people can also be stopped because the *hardware* costs too much or is difficult to obtain. I'm sure many hams would like to build an 8877 linear amplifier, but they're stonewalled by the difficulty (cost) in obtaining the tube, socket, and other hardware.

Believe me, I don't like this situation either. I just don't think it's fair to single out software as an ingredient that must be given away for free in order to make a project suitable for publication.

73,
Jack WB3U

6111. Please re-post info on Portland, Oregon ham store closeout

Newsgroup: rec.radio.amateur.equipment

Garry Foster <gmfoster@epix.net> wrote:

> And as a league rather than a for profit corporation I feel at
>least some thought should be on what is best for the membership.

First, I think what you're really saying is that some thought should be on what *you* think is best for the membership.

Second, there's no such thing as "best for the membership" except when fundamental policies affecting the existence of Amateur Radio are at issue. We're not a single entity or homogenous group; we're individuals with different needs, wants, likes and dislikes.

>I have made a reasonable living over the years in this general field
>and could not have done it if 30 years ago all the authors thought
>thier work was to valuable to share with those less knowledgeable
>than them selves. You have never been a member and if this trend
>continues I will cease to be one.

I'll say it again - force the League to dismiss articles such as this one and you won't gain a thing. You'll just reduce the amount of otherwise useful material available for publication. The same will happen if you cancel membership, because membership funds ultimately provide the ability to attract qualified authors.

Before I forget,

Happy Holidays to Everyone and Have a Great New Year!

From: Robert Blumenkranz <radiobob@earthlink.net>
Message-ID: <30DE226B.3922@earthlink.net>
Source record: 208274

It was my Ft-900 that Joe was refering to. I went through three of them before they discovered that more than just the micro can cause the problem. In my case after the third Ft-900 from Yaesu, they discovered that I had an bad (straight from the factory) remote head cable. It was causing the problem. But you also need to make sure that you have the latest micro. If not you will have the problem forever.

Mine never shuts off anymore. But I have another beef. I have never been able to see the Noise blanker do anything. I have many other rigs that kill the noise right away, but the FT-900 Noise blanker does not seem to work at all. Anyone else had this problem???

Good luck. 73 Ni6r

From: Robert Blumenkranz <radiobob@earthlink.net>
Message-ID: <30DE4542.5EEF@earthlink.net>
Source record: 208276

I have a Gap TITAN. It works on the ground OK. When I
put it on the roof it was a disaster. I could not even
make it resonate! It seems that the counterpoise ground
is very critical and the distance that the antenna is
mounted above ground (a few feet) is also critical. The
antenna works as poorly as any groundplane. The average
dipole or inverted V is a much better antenna. There is
no magic about the GAP antenna. It is really an inverted
dipole on most bands except the low bands. And on those
bands the ground plane is definetly required!

Ed makes some useful points here. However, one of the main purposes of
Amateur Radio is the furtherence of the art. Witholding the software
that drives a project dependant on that software "art" does little to
advance the state of knowledge of the reader. Since the author obviously
isn't trying to make money on the source code, (at this time, at least)
at least a detailed description of the software, sufficient for the
energetic builder to re-create it, would seem an absolute requirement
for publishing in QST.

Well, I just purchased my first previously owned radio through the mail and it arrived and checked out just like the seller advertised. Looks great, works great.

One small hitch, the rig was a one owner who smoked. The shack now smells like old cigarette butts.

Anybody have any experience with eliminating the problem or at least minimizing the odor? I have a dish full of baking soda next to the rig and it helps a bit. Any other thoughts?

Thanks!

Ron

Can't tell you much about that specific amplifier, but I use an old
Gonset with (4) 811A's. These tubes easily output 1KW peak on SSB and
700-800 watts CW. They last a very long time and they're cheap.

As for Ameritron, I constantly run into folks on the air using their
amplifiers. I've yet to hear anything but good about the products and
the company.

Dear John:
You are sh-t out of luck may be.
From over 5 years ago, the Japanese PTT has asked Japanese manufacturers to abid by an unwritten rule. It is called the J mark. On the side of the carton of the radio, there is
a triagular symbol with a letter "J" inside. This mark indicates that the radio is not modifiable. Pre-88 or so radios were easily mod'd for expanded rx and tx.
(I know for a fact that the Standard C500 was ok I had one, and so was the first bunch of C520's but not any later models) At that time, the Japanese police were still on VHF and probably had a lot of interference, before moving up and in to SS.
If you radio was old stock, ie there was no J mark on the carton it should be modifiable. Standard radios typically needed to have a diode removed to expand rx and another diode added or removed to add expanded tx. If it is a J marked radio , it is possible to expand the rx range but not the TX. One has to change the original CPU to a export model's cpu..
You should contact the Standard sales / service station near by.
Many pre-J mark era Japanese domestic models needed only a wire cut aka the typical US Mars/CAPs mod, but not all. I have access to some mod'd lists at home, but I don't remember if the C112 was listed. I threw away all my old catalogs, so I can't remember what vintage a C112.
Stardard has their own type of battery back design. The only compatible battery back in the USA that I know of is Heathkit's. Heathkit at one time OEM'd VHF radio's from Standard, and thus some Heathkit battery back may be available. This goes similarly for the instruction manual, I know for a fact that the instruction manual for the C500 was available form Heathkit, because I gave my dad a C500 for a present. He couldn't understand the manual either so we ordered an english version from Heathkit for a few dollars. I don't know if Heathkit carried a oem version of the C112.
Good luck with your CPU change.
Peter
PS some later models could be mod'd with a keyboard command sequence upon turning power on, but again this mod is only good for pre-J mark vintage radios for expanded TX.

I'm seriously considering purchasing the above unit (although not necessarily a brand new one).

What I would appreciate knowing is whether the Model 563 is the most current version and also what is the latest revision or modification no.

As well, all comments, both positive and negative, would be appreciated.

Finally, if you have any suggestions on minimal configuration (phone and digital use only), they would be greatly appreciated as would any leads for pre-owned units.

Thanks in advance.

I am in desperate need of the Manual for the ICOM Dual Band HT IC-24AT.

A photocopy would be just great and I will reimburse for your time and expenses.

Please reply via E-Mail

I read your message about your Alinco DR600 with it's software glitches in remote control mode. I have one that would display the wrong frequency after turning off crossband mode from an HT. Just out of curiosity, what kind of problems are you experiencing?

Thanks in advance....

Kenwood is definately guilty of sending out different models of radios with the same problem. I know several people with Kenwoods that have the old problem with the display going haywire and also several friends have the problem with the top row of mic buttons not working correctly. (intermittant short).

Nice to meet you.

I want a world band radio. I have use a old one which is not digital.
So I decided to buy a short wave radio.

I want a model of SONY because they are very popular at my place.
The model are ICF-SW30, ICF-SW33, ICF-SW7600G .

I don't like to listen the ham band but standard English
broadcasting.
Please help me choose the model.
Good Buy.

Wanda M Desmond (ke6tgn@ix.netcom.com) penned:
: Title pretty much says it all. Need a schematic for a DTMF decoder
: using the SSI202P chip (I picked up three of the chips at a swap meet
: for a buck each, they were still sealed in their Rat Shack packaging).

: I need a unit that is handheld, uses an LCD screen, and is not
: connected to a computer.

: Thanks!!
: John
: KE6TGN

If you got R-S parts, then the schematic should be stapled to the
package. It had several pages of info, basically the whole data sheet.
If you need it, SASE and I'll send a copy.

6153. Mocom 70 to 70cm Packet

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-25 00:00:00 UTC
From: gayle@ldd.net
Message-ID: <4bn890$9ot@sparky.midwest.net>
Source record: 208288

Hope someone out there can help with this...

I have an old Motorola Mocom 70 UHF rig with the following info:

MODEL # --------- U44BBN3110A
TRANS TYPE --- CC4112
SERIAL # ---------- NC173M

Is it possible to put this rig on 441.050 MHz for 9600 bps packet?

If the 441.050 freq is beyond the abilities of this old radio, what
about 446.075 MHz at 9600 bps?

I have pretty much zero tech info on this radio... I got it about two
years ago at a 'fest from an ARES group that had a ton of the things
they were selling to raise a few $$$... For $25, I figured it was at
least a good donation! ;-)

Anyway, I'm tired of tripping over the blasted thing and the XYL
(N0UTX) is _really_ tired of cleaning around it! If I can press it
into service on packet, that would be great.

Any help, info, ???? on converting the Mocom to one of the above freqs
(prefer 441.050) at 9600 bps would be greatly appreciated!

Take Care & 73

Jeff Fischer@thefishnet.com (JEFF FISCHER) writes:
>I have a Vertex 4 channel UHF mobile radio that I need to get
>programmed. Looks like a Motorola, but not too sure about this radio.
>Anyone know anything about one.

I own a 24 channel Vertex VHF. It programs via a PC interface/SW package
from the dealer. As I recall, our local dealer gets around $15 to
load up a unit's memory. The connection is thru the mic jack. A cable
with some interface circuit molded into the DB25 on the PC end is needed,
along with the Vertex SW. Suggest finding a local dealer. Last I checked,
the cable and SW were about $45 to buy outright, and they sell to anybody.

If it helps in finding a dealer, "VERTEX" is the commercial line put
out by YAESU. Perhaps a Yaesu dealer could assist you??

6157. Re: Advice on R-7 and grounding(2nd floor shack)

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-25 00:00:00 UTC
From: CBAX63A@prodigy.com
Message-ID: <4bm01v$27bi@usenetp1.news.prodigy.com>
Source record: 208292

It's not clear how much power you are using but if you are using over 200 watts or so I do strongly suggest that you use ONE ground strap as short as possible directly straight down from the rig with the longest ground rod available.

Use a couple low pass filters maybe one between the Transmitter and Antenna Tuner and if necessary an additional one between any Exciter and Amplifier. Have a Television nearby to check how clean you signal is or listen to you own Stereo System, Telephones, etc. for any problems.

I have a second story shack also at full legal power and have always used the Artificial Ground Tuner made by MFJ even on my past first floor shacks with good short grounds. The manufacturer advices that the subject tuner acts as a counterpoise needing no direct ground connection just a cut wire of a certain wavelength. They also advise, and I use, the unit wired in series with the best direct ground I can make then follow the rather detailed but simple tuning instructions. Again listening to your own electronic devices within your home helps tremendously.

I would be interested in knowing what you intended to accomplish with so many unattached ground rods straps around your antenna mast. I'm sure you were reading something that gave you the idea.

Hope this helps.

Hi Jack,

In article <819837219.25511@pinetree.microserve.com>,
jackl@pinetree.microserve.com (WB3U) writes:

>Hi Tom,
>
>Are you sure those goals are mutually exclusive? There are always
>parts used in a construction project that must be purchased, rather
>than fabricated. What about an article that builds on a new IC
>only available from one manufacturer? Isn't it possible that the
>IC could be homebuilt using discrete components?

OK, let's look at that. Suppose the manufacturer ONLY provided pin in's
and pin out's of that chip, and did the rest of the entire project. And
they gave you no hint of wow the IC handled the problem. Do I think they
should have an article printed? Heck no. It would be a self-serving
article.

> Why is it
>reasonable for the IC manufacturer to withold the blueprint of the
>IC, but software must be disclosed?

They don't do that very often. The only time they do is if is a custom IC
that they want to restrict access to so they can control it! Virtually
every chip has pin in's and pin out's, function block, and detailed specs.
If they don't and are sole sourced, they DON'T belong in a learning
article.

>No offense to anyone, but I
>don't think this argument is based on furthering the art of Amateur
>Radio. I think it's based on what some readers percieve to be an
>unnecessary expense.

I disagree. It smells of selfishness, a lack of consideration for the
builders, and detracts from the educational value of the project. It's
fine in a consumer device, but not in a fellowship where people are
supposed to be helping each other.

>>I can't image the software for the tuner is very unique. But it may
>>stop good hardware people from doing the project, or software people
>>from improving it!
>
>That's really not a fair evaluation. Good hardware people can also
>be stopped because the *hardware* costs too much or is difficult
>to obtain. I'm sure many hams would like to build an 8877 linear
>amplifier, but they're stonewalled by the difficulty (cost) in

>obtaining the tube, socket, and other hardware.

There's a huge difference. The builder could select another similar tube, and with appropriate voltage adjustments....plow right ahead. The true analogy is more like doing a project with a complex circuit block that has no published data. The tube is much too simple a device, so it doesn't really compare to the micro. Besides, any tube has it's internal functions fully defined for the public!

>Believe me, I don't like this situation either. I just don't think
>it's fair to single out software as an ingredient that must be given
>away for free in order to make a project suitable for publication.

I sure do, they could at least include a flow chart. I think it's very poor judgement to withold critical (or even interesting) information on a "public project". Suppose I did a nice phased receiving loop article, and withheld details on combining networks and phase shift systems that were key to the system's performance. Suppose I offered the missing system block as part of a "kit" available only from me. That's a much better analogy. Someone else could design a new phasing block, but why not make my work available so they had a baseline to work from? Is the object here to get paid for our work, or to help others? If it's to get paid, they did it the correct way. If it's to help others, they didn't.

Withholding a key area of a project shows poor consideration for the readers. I certainly see why some people are upset.

>Please - take some advice
[snip in consideration of bandwidth]

A little off direct point, but here we go with the bitching and moaning of an RF engineer who has been making this stuff for almost thirty years.

Everybody wants a thousand memory channels, five hundred odd-split memories, a digital clock with five time zones, an alarm that warns you of an impending anniversary, and puts out half a kilowatt on a single AA cell (rechargeable).

When the manufacturer shoehorns all that crap into the matchbox-sized case you wanted by dint of little tiny parts with little tinier solder joints and littlelittle itsybitsy wires connecting the boards together, it is going to fail. The more parts, the better the odds it is going to crap out, and if you want to know just how soon, go through the following math: Figure each part has 99.9% reliability for a ten-thousand hour life. Figure two thousand parts in the little booger and you find that roughly 15% of the radios will make it to the ten thousand hour point. 85% of them will have crapped out somewhere along the line. 99.9% @ 10,000 hours, by the way, is one hell of a reliability to ask of ANY component, much less one that is beat up, slammed down, twisted round, and generally given about as much care as the average trash can.

What's the answer? Demand radios that do what you want -- communicate. PL? Of course. Memories? How many of you use ten, no less twenty, and sure as hell not a hundred. A couple of watts for a HT and twenty watts for a mobile? Sounds about right. Asking for more is asking for less reliability. It ain't rocket science -- the equation for reliability is well known.

Back when I was fixing TVs to work my way for high school prom money, Zenith had an ad campaign showing all the parts it could take out of their TV sets and still have the TV "work". Whenever we got a Z in for repair (and we did, on a regular basis) we always said that if they hadn't put all those damned parts in, they wouldn't have failed and taken out the rest of the circuit when they did so.

My engineering paragon has always been the engineer back at Old Man Muntz' shop that designed a TV set with five (count em, five) vacuum tubes. Each tube did about half a dozen jobs in a Muntz by a clever scheme of bypassing and coupling, and I'll be damned if those old

Muntz sets didn't have the best reliability of the bunch.

KISS and BURP.

Ron,
You might try a good circuit cleaner like a freon-based component
cleaner or contact cleaner. Pop open the case and bathe the boards in
cleaner. You'll be amazed at the color of the fluid as it drips off
the boards...yuk!!! This should help.

>73,
>Jack WB3U

Well Jack in my case you couldn't be more wrong if you tried real hard. I mean the man only wants $20.00 for the programmed controller. I haven't looked up the price of the virgin controller, but I can't imagine that I could save $5.00 doing it myself if I had the programmer. So the problem certianly isn't saving money. The problem is what if I spend the 150.00 and the code has problems? Or I get to much rf in and burn the dang thing out in three years. The chip will still be available but more than likely the author won't program it for me.

And the most important thing is that I won't learn a dang thing from this even if I spend the $150.00 to build it. "L" networks have been covered many times over the years. And I have been soldering for more years than I care to remimber. However I have never studied the code for a micro controller based auto tunner. I do have every article ever published on auto tuners in the amateur field. And even one from a Navy publication back in the 50's. What intrests me about this on is its lack of a phase dectector. Allmost all the servo based tunners, and the circuit for the Icom tuner use both phase and magnitude detectors. The lack of a phase detector in this project concerns me. Therefore out of curiousity if nothing more I'd like to see the logic behind this tunner.

And I can't imagine that I am the only member of the ARRL that has similar intrests.

Oh by the way with the cost of membership these days none of us who are members can be to cheap or we would just go to the library.

I no longer subscribe to any other publication and really miss Jim Fisk and his great publications.

I may still order the product as the price is right. I might even consider an additional 50 bucks for commented source code.

>comments positive or negative that I could relay to him.

Hi Todd,

I have had my DX-70 for abt 4 months now and love it. The noise blanker stinks but I am told that Alinco has a fix and all I have to do is ship it up to them for the mods. I use it both mobile and fixed and it performs well. Fixed on 6 meters is a hoot and I have had a ball on this "new OLD band". I can recommend it highly.

BTW, I have the split cable and run the rig separated ... Great in the car and handy in the shack. I velcro'ed the head to the console above my FT990 and can monitor whatever I like. Also works nice to receive RS-12 with the 990 Xmitter.

Have fun & GL

I have been using the Timewave DSP-59+ for the past year. It is excellent in SSB and Digital modes and fair/good in AM Mode. With the latest ROM, the 59+ provides for variable depth noise reduction from the front panel, and also signal regeneration (recreation) in the digital modes. The reason why I give a "less than excellent" rating in AM Mode is lack of bandwidth. The specified high end is 3.4 Khz which is not quite high enough for good broadband noise reduction under some AM listening conditions. (Timewave has a new unit on the market, as of November, which is optimized for AM - Model 599zx. Also, JPS has a reasonably priced unit, NTR-1, which is a wideband noise and tone remover: I have not tried it.)

> don't think this argument is based on furthering the art of Amateur
> Radio. I think it's based on what some readers percieve to be an
> unnecessary expense.

I don't understand your last statement at all. As was pointed out in
the discussion about the tuner, the expense of the programmed chip
was only slightly more than the cost of an unprogrammed chip. I
find it hard to believe this debate is because some people don't want
to spend an extra $5 for the programmed part when the entire project
is over $100 in parts along. I know amateurs have a reputation for
being cheap, but that is carrying it a bit far.

As to the IC argument. I guess if the manufacturer of the IC was
the author of an article that required one of their sole source parts,
I'd have a little bit of difficultly with that being published. Perhaps one
could argue that if Signetics tried to publish an article about an NE602
based receiver, that it might be questionable. The difference I would
see is that the function and construction of an NE602 is such that
other chips from other manufacturers although different, are close
enough to figure out an alternate design. Or particularly in the case
of the NE602, how to build an oscillator base, buffer, and doubly balanced
mixer (are those all the pieces of one?) are well understood. In the
case of software, it is generally not the case that the design of the
software is well understood. Now I believe that in the case of the tuner
article, a flow chart or similar design model of the software was

submitted by the author but not published. If that really is the case, then the problem there was with the publisher (editor?) and not the author.

One other comment about your above paragraph. The goals/purpose of an IC manufacturer and what is expected of them are a bit different than the amateurs submitting articles to QST. I don't see manufacturers of IC's submitting articles, so what they do with their designs is completely up to them. Their goal is to make money from their designs. If that is the goal of an author submitting an article to QST, then they've choosen the wrong avenue. They should have gone to a manufacturer or started a kit business on their own. (I'm not suggesting that this was the goal of any particular author.)

73,
Todd

Seems to me I read somewhere that Harris Corporation of Melbourne, FL makes a radio used by the Navy that can move duplex signals at 9600 baud over HF. Don't know if civilians can buy them or how much they cost. If you find out let me know.

Good Luck

6188. LO-Z -> HI-Z mic adapter???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-26 00:00:00 UTC
From: charles1@netcom.com
Message-ID: <charles1DK6Hnq.2nF@netcom.com>
Source record: 208224

I have a TS820 that requires a high impedance mic (50K).
I bought it with a Electro Voice 607 LO-Z microphone.
The EV607 impedance is unknown other than "LO-Z" stamped
on microphone.

Does anybody know of a way to adapt LO to HI impedance
microphone? Audio transformer?

Any details would be helpful.

Message-ID: <4bo7t8$fbj@oskgw.osk.sony.co.jp>
Source record: 208225

Hi:
You two seem to be very knowledgeable.
Let me mention my two bits.
I live in Japan, and I will comment from my vantage point.
I don't know all the in's and outs of the intermod problem but perhaps
the following facts will shed some light, hopefully:
In Japan the : 1) FM BC band is 76~90 MHz
2) terrestrial TV channels (center frequencies)are:
93,99, 105,173, 179, 185, 191, 195...

Perhaps the ICOM engineers cut costs and corners based upon their knowledge of the
Japanese air waves and did not consider the USA/Canada which has a higher and wider
FM BC band. Furthermore, the Japanese FM BC stations are relatively speaking very
low power.(some stations are only a few watts) Commercial use of VHF is light in
comparision to North America,
many services have already migrated up. I am not sure but commerical services may be
restricted to a lower power level than in NA.

May be intermod is not a big deal in Japan, besides in Japan 2m is basically
a useless band since it is crowded, no repeaters, and very narrow, 144~146 MHz,
atleast in Tokyo.
Again the designers may have placed little emphasis upon the 2m performance since
most VHF users have become frustrated and have already moved up to 70cm or 1.2GHz
or they use very sharp stacked beam arrays.

One final point, the Japanese domestic version only rx's up to 2 meters and not 200 MHZ.

Hopefully, the above made some sense.

Peter

Hello.

I have obtained a Swan 1200 x amp that has no user manual.
It is in mint shape, clean enough to eat of off. I am having trouble
getting it loaded. I don't know if the tubes are flat or if I'm doing
something wrong.

If I could get a copy of the user manual I would be eternally
gratefull.

I am very new to Ham radios, but I am reading up on them so I will actually be able to understand the chatter in this forum =) My question is this: back when I was in high school, a few years back, two students got expelled for using portable Ham radios for making long distance phone calls. Not that I would want to do that, but the idea sounds interesting. I have heard rumors of being able to use a portable unit in conjunction with your phone at home to make outgoing calls, or take incoming calls. I've heard of something called a "phone patch kit". Does such a thing exist?

6199. Re: Gripe about QST Automatic Tuner Article

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-26 00:00:00 UTC
From: Cedric Walker <Cedric.Walker@Tulane.edu>
Message-ID: <4bp134$gkc@rs10.tcs.tulane.edu>
Source record: 208235

I, too, was annoyed by the "source code is not available" footnote in
that otherwise-excellent antenna tuner design article in January's QST.

Ed Hare, at ARRL, put forth a "we made the right decision" post earlier
in this newsgroup, and
jackl@pinetree.microserve.com (WB3U) wrote:

<<snip>>

>... The ARRL has to make a decision in
>publishing articles such as this as to the depth of proprietary
>disclosure and resources. That's true in any construction project.
>The question is, should you refuse to publish an article because
>an author witholds certain information? There are characteristics of
>the manufacturing process that no manufacturer will disclose, but that
>doesn't necessarily preempt their product from being utilized in a
>construction article. To my mind, this situation is no different.
>The author has a right to protect certain aspects of his work, but
>that doesn't automatically render his project useless to the builder.

... so now it's my turn:

Let me offer another point of view. Since the preprogrammed "HC11 chips
are being offered for only $20, nobody's going to argue in this case
that the author is out to make big bucks from selling his software.
That means that the mercenary argument can be removed from this
discussion and it can center on policy instead.

ARRL, like all publishers, tries to maximize the value of the
intellectual property that they own by offering for sale reprints,
collections, books compiled from selected articles, and so on. That's
fine, 'cause it can keep our dues down.

Now let's assume, for a minute, that the firm (it's a sole source)
selling the pre-programmed 'HC11 chips suffers some business reversals
and goes out of business in 6 months. The economic value of the
intellectual property of that article (for ARRL) has gone to zero,
'cause it's against their best interest to publish design articles with
unobtainable parts.

What's the argument _against_ archiving the source code on an ARRL FTP
server? Maybe for 6 months, the author should have the sole right to
sell his software (in the form of programmed 'HC11 chips). But after
some time window has elapsed, the copyright agreement that the author
signs with ARRL prior to publishing should permit ARRL to release full
source code. This protects the longer-term value of ARRL's
itnellectual property, but still allows the author to enjoy (for a time)

some economic reward for the good design work that he did.

In following this thread, and having written to the QST editors, I've been most impressed with ARRL's willingness to participate in and contribute to this discussion. I happen to think they were wrong, but their decision was neither capricious nor ignorant, and they're to be commended for taking the time to explain their actions. They deserve our support!

Is there really a double standard? I've yet to hear complaints about
microwave construction projects not including the full computer model,
even though an expensive modeling program was used in the design. Such
a model accurately describes things like parasitic inductances and
capacitances associated with real parts. Should our policy with
microwave projects be more like DUBUS or the RSGB's Radio Communications?

6203. European EMC Standards (NOT!)

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-26 00:00:00 UTC
From: w8jitom@aol.com
Message-ID: <4bp5rg$9m9@newsbf02.news.aol.com>
Source record: 208239

I need some help!

January first a new standard of European community RFI/EMC standards are supposed to go into effect. It is my understanding (from trying to collect the documents over the past year) that all standards are not in place even as of this date. Great Britian and others allow manufacturers to self-test their equipment, but Germany will not. I was told Germany requires a lab on European Community soil to do the testing.

Now the EC labs want a huge amount of money per test. If I was allowed to do the EMC tests here on my test range my direct cost would be under 200 dollars per unit, but two German labs want 15 to 30 times that amount. I was also informed standards will likely change in the near future as all the EC countries reach agreement.

Let me give an example. To export an antenna tuner to Germany, I was told it has to be tested by a German lab for EMC compatibility. So I sent a tuner to a lab and they hooked it up (with no transmitter) and tested it. It passed, it had absolutely no harmonic radiation! And it only cost $3000 US to find this out! The same tuner does not require testing in Great Britian, it is a passive device not part of any defined "system" and can be exempted from testing. But if it did require testing BSI told me I could do it here!

I am told by German labs they even need to test speakers and microphones for harmonic radiation and EMC !!!!!!

Does anyone know how I can verify the accuracy of my understanding?? Or who other than a test lab in Germany I can get information from on the German BZT or other applicable German laws??

I suspect I am being ripped-off.

73 and Thanks,
Tom

6204. Question: Ge master ii at

Source record: 208240

DB>From: "Donald I. Baker" <dbaker@mail.bcpl.lib.md.us>
DB>Just aquired 2 of these (1@100 watt and 1@50W). Both have Pl's and
DB>reeds. Simple question, who can send me info on disabling of the PL's
DB>and reeds. Want to use them as carrier not tone squelch.

The easiest way to disable the PL is just to remove the card. That will remove both TX and RX PL. BUT you also have to put back the TX PTT jumper. With the radio on the table, front panel connector closest to you, the PL board is the long board in the front compartment. Remove it. Then look at the PC board the PL board plugged into. Look for a couple stubs of wire about 1/2" in front of the left side PL connector pins. You should see 3 or 4 holes in a pyramid with one stub of wire and one more hole about 1/2" to the right with another stub of wire. The stubs of wire are the TX PTT jumpers that get cut when the PL board is installed. Just solder the wire stubs back together. The alternate option I use is to solder a 1N4001 or similar diode in place of the stub. If you solder the diode with the banded end toward the right (middle) of the PC board, the PTT will work either with or without the PL board installed. (If you solder the diode in backwards, the PL board and diode will cause the radio to hang in continuous transmit.) I do it this way so I can install or remove the PL board at will.

DB>also...The 100 watt will be put up as a fixed link-able remote base on a
DB>440 system. How far do I need to "turn down" the 100 watt to let it run
DB>at a high duty cycle (most off, but on at 50% or better during use).

The GE manual says that all MASTR II transmitters can run continuous duty at 40 watts or less. I've had trouble getting the 110 watt TX to run correctly at such low power but they generally will run in the 40 to 50 watt range. But that only means the final transistors are OK. The single most failure prone point on the GE TX is the power control transistor. If you pop the cover on the TX amp stage, look about 1" right of where the exciter power cable comes in. You should see a TO-220 tab transistor mounted to the thin metal that forms the front of the TX amp. This is the power control tranaistor. When you operate the TX at reduced power, this transistor reduces the collector voltage on the driver transistor from 10-12 volts to 4-6 volts. All the extra heat is dissapated in the transistor and it tends to burn out.

The best fix for this is to remount the transistor on the heavy side heat sink of the radio. What I do is remove the side panel of the radio along the left side. Then I drill a new hole thru the side panel about 5/8" below the top edge of the panel and counter sink for a flat head 4-40 screw. Don't forget the tab insulators when you bolt the transistor down. Then twist three colors of wire together, solder them

on the transitor leads and insulate the leads. Solder the other ends of the three wires where you unsoldered the transistor. If you're careful you don't even have to dismount the PC board. I've done everything from the top side of the board. Just be sure you use an ohm meter to verify you have the same resistance before and after the modification, no shorts.

A second option that you may also use is to build a simple T attenuator about 6 to 10 dB attenuation and put it between the exciter and TX amp. By reducing the drive you also reduce the power drop in the power control transistor, make it less likely to fail and make it easier to set TX power. If you are willing to add fans for TX cooling, you can really beef up the TX amp by mounting another heat sink on the BOTTOM of the TX amp compartment. I've taken a heat sink about 2.5" x 5" x 1.5" and drilled extra clearance holes in my heat sink to clear where the transistor mounting screws come thru the bottom of the GE heat sink. This let me place the new heat sink in good contact with the GE heat sink casting. I used some heat sink compound and used some 4-40 standoffs and a couple chunks of scrap metal to form a hold down clamp for the new heat sink. I also added more heat sink compound to the side panel castings and even filled the empty cavity between the heat sink casting and the side panels for better heat transfer.

With two 5" 12 volt fans blowing on the heat sinks, running 110 watts for 1 hour, the hottest parts in my TX are the 2 watt base resistors in the TX amp compartment. They seem to be the last failure prone part. A real GE base amp has twice the heat sink on the back of a mobile TX and adds a fan blowing on the top of the TX amp PC board. I'd use at least a small fan to blow air on those resistors. This is essentially all the mods you should need on the TX final amp. I've found the GE Mastr II to be well built and fairly easy to tune. The few times I've had tuning trouble it is always the stage before the last transistor in the exciter. If you stop at that point and go back to the GE directions it will generally work out OK. Another easy option is to use a sensitive power meter with a dummy load on the 50 ohm output of the exciter. I use a modified CB SWR bridge that is very sensitive. Then I can see the RF output even when I can't read it on the test point. Just peak for max and recheck tuning with the test points when done. It works for me. Good luck.
73's.

Base Rigs are traditonally CB radios, most Hams have home or fixed stations. If you want a good base rig buy a President, a used Siltronix 10/11, or a Tempo one.

If your looking for a Ham radio fixed or home station, there are a bunch to choose from. I always try to buy used stuff that has a good reputation. Then I don't spend thousands of bucks on a mistake, hi.

>he claimed these rigs have terrific circuitry design, but the worst
>implementation he has ever seen.

..snip...
I have heard similar opinions, but i have to say.... MALARKEY!!!!
TT makes excellent equipment, it performs very well, and is extremely
rugged. They service everything they have ever sold, and are very
compliant on solving recurring problems. The paragon is an intersting
case because it is a synthesized general coverage rig, unlike the OMNI.
TT rigs rely on a modular approach to allow ease of service and greater
ruggedness. It may not look like a 950SDX inside, but try to service a
950SDX sometime!!! ouch.

My opinion is that TT detractors are Japanese-rig snobs who have bought the
"stateseide made = second rate" bunk and wuvv their wittle wiggs.

Take advantage of the TT money back deal, no risk pardner.

Yes, Phone patches exist and the best way to use one is to join a
local repeater that has one on a high mountain-top somewhere.....

I'm very interested in hearing more about the kids that were expelled.
What else prompted the expulsion? I find it hard to understand how
(legally) two students could recieve such treatment...........

Are you by chance talking about a RELM WHS-150? The WHS-150 is a portable 150-174 mhz radio that can be key pad programmed. I think that I have a programming sheet on them somewhere around here. Don't know any thing about a "Whistler" 150 though.

>Then I don't spend thousands of bucks on a mistake, hi.

I'm also a tech plus and went thru the same thing you are, finding
a cheap older rig that has retainable value.

The elmers, who had something of value to say, recommended:

TS520SE - $275 all transistorized except for reliable and forving finals.
(S means has digital display, E has heater switch)
TS820S - $350 all transistorized except for reliable and forving finals.
(S means has digital display)
FT101E - $300 all transistorized except for reliable and forving finals.

All three have very common 6146 (AKA 2001) tube finals that are easy
to replace. There are little to none proprietary parts and easy to
fix, so can not be orphaned.

If you want something current and cheap the TenTec Scout can
be had for about $500.

A more recent and most interesting radio is the 706. It costs
$1200, but has 2m,6m,10m-160m all in one compact package.

If you are REALLY on a budget You can get one of many QRP CW
kits. They cost $80-$500. The Norcal 40a costs $129 and highly
praised. It is all pcb mounted components so no messy wires
like other kits.

Tech plus are only allowed one band for voice on HF, 10 meters.
You can get a Radio Shack 10 meter mobile rig for $100 used.

Source record: 208252

charles1@netcom.com (charles copeland) wrote:

>Does anybody know of a way to adapt LO to HI impedance
>microphone? Audio transformer?

It's possible to build an active converter for this and that's
probably the "correct" method. However, I've been using a transformer
for some time with good success. In my case, the transformer is a UTC
ouncer rated at 1K : 50K that came from someone's junkbox.

Some of these miniature transformers are expensive, over $20.00 each.
However here are a few you might try:

Mouser Electronics (800) 346-6873
No. 42TM117 50K : 1K $2.36
No. 42TM017 25K : 600CT 2.36
No. 42TM006 20K : 1KCT 1.98

Hope this helps.

6217. MOTOROLA GP300 Software Help

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-26 00:00:00 UTC
From: cardenas@kaiwan.com
Message-ID: <4bpnd5$k07@kaiwan.kaiwan.com>
Source record: 208253

I have access to licensed Motorola GP-300 software/program and program hardware/fixtures (a metal bed the radios rest in while programming). My radio is the 16 Channel, UHF, *TouchTone version with speaker mike.

Sadly, the F-1 Help/instructions are VERY poor! The Options and Commands on screen have very vague and misleading wording. I lost a lot of time getting this far.

* At present I have all 16 new UHF frequencies and PL's installed. All channels and PL's work fine. My new 'scan' list works fine.

** Since the new frequencies were installed the following items no longer work (but DID before the new freqs. were installed):

1. *TouchTone pad only issues a single-tone.
2. The two options buttons above the PTT no longer work.
3. The Speaker/Mike jacks don't work.

The owner of the Programming equipment does not have the MANUAL for my GP300, nor does he have the specific programming manual/instructions for the radio.

*** I'd love to have a photocopy (or original) of the programming instructions/pages (not software)! I'll be happy to pay any copy costs and shipping. ***

IMPORTANT!!!

The owner of the programming equipment and software is in the two-way radio business. He is a Motorola dealer but sells many other lines as well. He does NOT wish to provide *ANY* bootleg copies of radio programming software to anyone. A message requesting same will be fruitless.

Thanks!
Tony

I used a Motorola 67805P3 microcontroller to do something like this. Reads the BCD from the SSI202, and decodes it to control functions, if this info might help let me know, but there may be a stumbling block in writing the code for the purpose, and display driver.

>Zack KH6CP/1 zlau@arrl.org

Well Maybe? I don't really follow the microwave articles. However you
can't compare the expensive modeling program to the code for the tuner.
The comparision to the modeling software would be the assembler or
development package for the controler. And in most cases the authors have
made thier models availabe somewhere.

The more important point IMHO is that the microwave construction can be
duplicated with out the software, The tuner is useless without the code.
In fact the article even mentions the ability of the micro controller to
erase itself.

I don't have a problem with the author not wanting to make this
available, its his choice. I don't see the purpose of QST publishing it
as a construction article. Why not just do a product review and let him
buy advertising like the rest of the vendors? As stated several times the
price is excelent.

And again why is code so sacred? There is no way you would publish an
article where someone tried to hide the operation of thier circuits by
sanding off the part number of a device, and showing it as a box. However
a microcontroler without the code is the same thing.

Now maybe if the ARRL held the code and only released it when the product
ceased to be supported it could serve all parties. The learning potential
would still be lost,but long term support for buyers would be secure.

I re-read the article after reading the initial gripe about the article. I must agree that the author is not out to make "big bucks" on his source code since he does offer the chip for 20 bucks programmed.

In fact a real hacker has at least three options in addition to buying the "kit".

Buy the board only and build the unit from scratch including writing your own code which might be better.

Buy the chip and layout your own improved electrical design

Build your own from scratch using the knowledge learned from the article.

I will agree that putting the source code in "escrow" would be in the best interest for QST in the unlikely event that the author or the source code files were to go QRT.

I am interested in buying all kinds of pro-audio equipment
(mics,compressors, preamps, consosles etc) for my recording studio. I am a
serious buyer, and will pay your price for equipment that I can use.
Please contact me via e mail or phone me at 818-244-1909.
Thank you..... Mark

The following is a partial list of equipment that I am looking for:

Microphones by- RCA, Neumann, AKG, Telefunken, Schoeps, Altec etc.

Compressors, mic pres etc by- Langevin. UREI, Universal Audio, Altec,
Pultec, Fairchild , API etc

Any tube audio gear including professional tape decks.

6236. 2-meter rig suggestions?

Hi - I've been thinking about a new 2-meter FM rig to use as a base station. I would use this mostly for packet, and some phone. I'd like something with a dedicated TNC jack (so I don't have to keep switching mic plugs) and also something that will be able to run 9600 baud packet. Suggestions would be appreciated.

>Icom tuner use both phase and magnitude detectors. The lack of a phase
>detector in this project concerns me. Therefore out of curiousity if
>nothing more I'd like to see the logic behind this tunner.
>
>

Hi Gary,

That bothered me also. It must just take off in one direction at a guess,
and if it's wrong after several steps try the other way! The problem is if
the detector behaves the way most couplers of that style do in the real
world, it really needs a phase detector. I guess I would have paid more
attention if the software was described, who needs to see a bunch of
switched components!

The relays used (if they handle any voltage) should take between 5 to 15
mS to settle, and the rest of the circuit has to settle to the new
detector voltages. That's why the software interests me.

I go along with you on this. Everything I've done has used phase
detectors, except one medical device. But that device never went above a
3:1 load (that was the VSWR range caused by the difference between a large
round fatty female rump and and a skinny small male rear).

The point is, the circuitry isn't anything novel. How the guy gets away
(or doesn't, hi) with a simple detector in software may be though.

Cedric Walker <Cedric.Walker@Tulane.edu> wrote:

>I, too, was annoyed by the "source code is not available" footnote in
>that otherwise-excellent antenna tuner design article in January's QST.

Hi, Cedric,

I think the definative words here are "otherwise-excellent." But let me clarify a bit: First, if QST *ever* consists only of, or even mainly of, articles that really are just a description of a kit that contains proprietary information not avialable to the readers, I am outa' here; I have more important things to do with my life. But the likelihood of that happening is essentially zero; ARRL HQ is populated with a lively group of hams, including some top-notch homebrewers who put a lot of effort into making QST into a tool that encourages learning, design and construction (among other things, of course -- there are parts of QST *I* don't read!)

In addition, we work to encourage our outside authors to obtain their permission to distribute source code. In some cases, we have been successful with an author who otherwise would have kept it proprietary.

But when all is said and done, it is the author who decides what he or she wants to offer to QST, and it is our editorial team that decides what we publish. When I say we made the right decision, it is not because I believe that it is not important to distribute source and other construction information, but because this is an "otherwise-excellent" article and construction project that is useful and important to the ham community and offers a good way to obtain an outboard automatic antenna tuner. If, IMHO, an article is still "appealing and useful" without the inclusion of source, as in this case I believe it is, I think it is the right decision to publish it. As an OBTW, I am not part of the team that decides these things; I am judging this as an outsider. (And even though my Boss is in charge of the QST team, as everyone who knows me knows, knows, that doesn't usually stop me from speaking my mind. :-)).

>ARRL, like all publishers, tries to maximize the value of the
>intellectual property that they own by offering for sale reprints,
>collections, books compiled from selected articles, and so on. That's
>fine, 'cause it can keep our dues down.

Actually, at $3.00 per reprinted article (ARRL Member rate), it is really not a big $$$ maker for ARRL. That just about covers the time to send our hard-working Tech Secretary into the ARRL Library, locate the article, make the copy, put the book back, address and mail it postpaid, etc. While there is an economy of scale in batch processing, at about

15-20 article copies a week, this is not a lucrative market. When you add to that the time spent for the requests for the "antenna-tuner article that appeared sometime in the 80s" (really found in 1962, in some cases), plus the fact that we often "bill" our Members who request reprints by telephone or email rather than have them prepay, not getting paid in some cases, I think it costs us a bit rahter than makes us money.

>Now let's assume, for a minute, that the firm (it's a sole source)
>selling the pre-programmed 'HC11 chips suffers some business reversals
>and goes out of business in 6 months. The economic value of the
>intellectual property of that article (for ARRL) has gone to zero,
>'cause it's against their best interest to publish design articles with
>unobtainable parts.

This point has been raised by a few. I am less concerned about the economic value of our reprints going down than I am that, if a company goes belly up, Members will have NO way of replacing that device if it fails. I am going to pitch to our editor types that if we accept any proprietary source articles, we do request that the author supply it to *us*, with the provision that we can release it if he or she ever stops making the devices available.

I am also passing along a request that if we can't obtain the source, we should ask the author if he or she is willing to supply a flow chart. That could at least help folks who want to learn more about how it was done. (I can make no promises on either suggestion, but they are good ideas and I will pass them along. Of course, when all is said and done, if the author does not want to take either step, and the article is still a good one, we may publish it anyway.)

>In following this thread, and having written to the QST editors, I've
>been most impressed with ARRL's willingness to participate in and
>contribute to this discussion. I happen to think they were wrong, but
>their decision was neither capricious nor ignorant, and they're to be
>commended for taking the time to explain their actions. They deserve
>our support!

Why thanks, Cedric, I, too, disagree with ARRL from time to time (gasp!), but when I look at the big picture, I still think the organization does some important things and is worthy of support. :-)

>I'm confused what HF is.
>
>I thought it was 30 to 50 MHz, with VHF being 140 MHz, and UHF being UHF.
>
>What is below 30 MHz?

MF = 300 kHz - 3 MHz
HF = 3 MHz - 30 MHz
VHF = 30 MHz - 300 MHz
UHF = 300 MHz - 3 GHz

Note that since wavelength (meters) is 300,000,000 / freq (Hz), this makes
sense.

MF (Medium) 1000 - 100 m
HF (High) 100 - 10 m
VHF (Very high) 10 - 1 m
UHF (Ultra high) 1 m - 10 cm

If I remember right, SHF (Super high) and EHF (Extra-high) are next.
Below MF, there's LF and VLF.

6246. 'ISM' type comm equipment: thread for 70cm band?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-27 00:00:00 UTC
From: geertj@ripe.net
Message-ID: <DK8z6r.Kp3@inter.NL.net>
Source record: 208140
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Hi there,

The Europification has brought some very bad news to European
hams who like to use the 70 cm band.
In most countries, this band is shared with the ISM service
(Industrial, Scientific, Medical). ISM is intended for those
applications where RF is needed (and can leak) for other purposes
than communcation: welding, melting, and the like.
One of the ISM allocations is 433.920 MHz +- 0.87 MHz.
The European 70 allocation is 430-440 MHz (in some countries
4332-438 MHz, may be even less). Small-bandwith is concentrated
on the lower end of the band; 432.300 is SSB calling freq,
433.500 is FM calling freq.
Other users (including hams), 'should accept interference caused by ISM'.
Since ISM is usually in industrial areas and hams usually don't live
there, these usages were more or less compatible.

Apart from ISM usage, this ISM band is also used for door openers,
car alarm remote control, and the like. This has lead to situations
where people were unable to unlock their car because of the neighbour
having a contest, but no serious harm was done.
All of these are 'low power apps'

However, some new rules may change that all. The low power apps
limit is now raised to 10 mW, and plans are made to build wireless
loudspeakers and 2-way comm equipment for the band.

Of course, if these applications are interfered by hams, then the
ham applications have precedence. (if you ever thought that RFI problems
were difficult, then try to explain THIS to an angry neighbour who
just bought a $3000 high-end TV set with wireless surround speakers!)
I'm not shure if the precendence rule will work for us in practice.

Another concern is the 2-way radios, as these may be compatible
with regular ham equipment, and we all know what can happen then.
Note that most of the 70cm FM allocation would be part of the ISM
frequencies, and there's no protection against someone calling himself
W1AW there - it would be nearly impossible to protect against making
contacts with non-hams.

Has anyone seen these 2-way radios yet? What frequencies do they use?
What raster? modulation? Are they provided with built-in CTCSS or something
like that? Would we hams be able to use CTCSS or something similar to
shield against the ISM folk?

How have other people dealt with this kind of situation? Are we doomed?

73, and best for 1996,

Geert Jan PE1HZG

No, I'm asking for the equivalent of the source code. A precise description of the circuitry so that it can be analyzed and possibly improved.

Together with the published results, this ought to allow others to test their modeling programs. Or, to possibly make component substitutions if they can't get the exact parts specified. Often, you need to characterize parts for microwave applications--I see some reluctance to share this information.

True, I have published a number of circuit descriptions--but it certainly would be nice to get other opinions on how to best model circuits.

6250. Question: Ge master ii at

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-27 00:00:00 UTC
From: n0nas@hamlink.mn.org
Message-ID: <820051477.AA04727@hamlink.mn.org>
Source record: 208144

Since you will be using these radios as base transmitters, there is another modification to the exciter you might want to try. The mike input is designed for a low impedance carbon/active mike. The mike amp IC puts about 10 volts on the input pin thru a resistance as required for a 600 ohm carbon mike. This voltage source in the mike amp IC loads down the input quite a bit, reducing input sensitivity and introducing high frequency roll-off. Removing the two components responsible for the mike bias voltage significantly increases the mike input sensitivity as well as improving audio response.

*** These directions are for the crystal controlled exciter, not PLL. First remove the exciter from the chassis. In the front corner of the board you'll see the mike amp IC. This is U101 on the schematic. It is a 14 pin inline circuit with pin 14 nearest the corner. Locate pin 11 of the IC. Depending on the exact board model, you should be able to follow the trace to a 22 mfd capacitor that goes to ground and a 200 ohm resistor that connects to the 10 volt buss, pin 7 of the main PCB header or pin 1 of the channel elements. On later model boards there is a wire jumper between pin 11 of U101 and the resistor and capacitor. If you have the jumper, cut it. If you don't have the jumper, remove the two parts. Removing the resistor removes the 10 volts. Removing the capacitor improves frequency response and gain. This does make it impossible to test the transmitter with the control head and mike. A similar change will probably work for the PLL exciters.

This mod and the previous suggestion for putting an attenuator in the exciter output to reduce power foldback were both developed by Chris Peterson, KF0FX (kf0fx@aol.com). Our repeater has not yet used any of these mods but they have worked on the bench. We have used an unmodified Mastr II transmitter for about three years. It originally ran for a year at 80 watts out until the power control transistor failed. After replacing the transistor it ran for another year until the transistor shorted. We left it and ran 125 watts out for another year until the 2 watt resistors in the final amp got flakey and the transmitter died. Our next transmitter will have all the mods from these messages. Another repeater used one of these amps for about 9 months before he had trouble with the resistors and the amp died. After adding heat sink, the GE base stations add a perforated metal cover over the whole final amp and a 5" fan blows air on the board.

The heat sink, power control transistor and resistors are the only trouble points I know of in this amp. If anyone else has suggestions for improving the GE Mastr II transmitter, I'd like to read them.

WMD>for a buck each, they were still sealed in their Rat Shack packaging).
WMD>I need a unit that is handheld, uses an LCD screen, and is not
WMD>connected to a computer.

Hi John.
The SSI202 is a nice little DTMF decoder with parallel binary outputs.
It is not capable of driving an LCD display without adding significant
amounts of circuitry, such as a small micro-controller (micro-computer).
What is fairly feasible is to have the SSI202 drive four LEDs to display
the binary or add more circuitry to drive a single 7 segment LED
display. You should find the basic SSI202 circuit in the ARRL Handbook.
I know I've seen it in the 1988 book and I'm sure it is in later years
as well. If you don't have a copy of the Handbook, you'll probably find
it at the local public library. The SSI204 is a similar decoder with
fewer pins. We use a lot of them at work from various mfgrs.

Isn't the real question this?

Should an educational article withhold information necessary to complete the project, especially if the information only applies to the project and can't be used for other applications? Isn't one of the goals of the ARRL to advance the skill and knowledge of members in our fraternity? Isn't that one of the reasons our hobby even exists?

Even a flow chart would have been nice, so the reader could learn a little bit about how the author solved the problem. That certainly couldn't have been a "major deal".

Besides the questions above, consider this fact of life. The real motive behind "forcing" builders to purchase something from an author is not important at all. The only thing that matters is what the readers **think** the motive was.

The reasons for not publishing at least a software description have been pretty lame so far.

73,

I did not have this problem with my 706, although I did have to bring
the MIC gain up further than I thought I would. (It is about maxed out.)
I found the adjustment of the mic gain while watching the ALC meter
confusing. I couldn't tell how much, if any, the ALC was pegging out
too far to the right. I considered this to be Operator Error. I am not
used to LCD meters.

73 and good luck...I'll be watching for other replies.

Source record: 208150
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I have an Atlas 210X that works fine on 40 meters and up. On 75 meters, I can only get about 40W out of it.
I hypothesize that if the high freq power out is ok, the transistors are good.
The 80M filters are not tunable, so they've probably not been tweeked.
Ideas?

The only thing I can think of is that one of the broadband transformers in the final have a cracked core and insufficient inductance to get to 80M. They look ok. I don't have any idea how to check it out without disassembling the transformer and checking each core. High risk of breaking something.

Any guidance would be appreciated. I do have access to equipment, GHz scope, spectrum analyzer etc. Don't be shy with wild test ideas.

thanks, miker

A Response

To: Stephen Bellamy, AA8MX

Stephen:

I've had the same experience with my IC-706. I have a relatively
soft voice, and have noticed (with other radios) that I don't
'push' ALC's nearly as hard as a lot of other people.

Try this ... go into the 'quick-setup' mode, and cut the RF
transmit power back to say 5 or thereabouts. Then watch your
ALC meter, I think you'll see that, at reduced power settings,
the ALC circuitry is much easier to 'push'.

Take heart ... my ancient Heath HO-10 monitor scope shows that,
even though I'm not making the ALC indication do very much
(with the IC-706's RF output set to "Hi"), that the RF output
looks 'about right' (ie roughly what I'm used to seeing with
my Tentec Paragon).

I'm currently building an adaptor, so I can use my Heil headset
with the IC-706. I called the folks at Heil, and a nice lady
there commented that they frequently have found that ICOM radios
seem to show 'weak' audio when using a non-amplified Heil
microphone element. So, I've taken a circuit out of the ARRL
'Handbook', and am going to build it into the adaptor,
to provide a bit of audio gain.

The authors wrote me that QST chose not to publish the originally supplied flow chart because they (QST) felt that the readers would not be interested. The authors will send you a free copy in return for a SASE to the address (I'm guessing on the address) in the article.
I do believe that QST chose not to print the supplied flow chart, but in their defense I don't think that they thought that we wouldn't be interested. Probably something more to do with available space.....and maybe the flow chart was rinky dink and it could be said that anybody interested wouldn't gain much from what was supplied. Trying to be FAIR here. I haven't seen the flow chart. I like QST and feel that it's extremely valuable in many ways to the art, so I hope that this controversy causes hams to join so they can vote, rather than join the chorus of quitters who think that quitting gives them power over their disagreements.

> > Besides the questions above, consider this fact of life. The real motive
> > behind "forcing" builders to purchase something from an author is not
> > important at all. The only thing that matters is what the readers
> > **think** the motive was.

Well, I don't know about this. I think that it's pretty obvious that the authors wanted to capitalize on their efforts (in the long run at least) and that QST decided to sympathize with them feeling that the tradeoff was a good one. In fact

that is exactly my problem with the whole thing. I never thought that I was being FORCED to buy something. I just think that QST should have ethical standards which would have led them to choose differently on this one. They could have given us access through a product release or something. Save the article space for learning. I have a hard time seeing how this article teaches much of anything in it's present form....it's kind of like a "73" article on how to make a relay box to switch antennas that belongs in that "New Ham" section. If the majority of us do benefit from the relay articles then maybe the exams ARE too easy (we know they are, but we could at least lie to ourselves a little by saving the serious space for serious stuff). Maybe we could aspire to greaterness.

From: spbellamy@aol.com
Message-ID: <4bsdnl$dfj@newsbf02.news.aol.com>
Source record: 208157

I got an ICOM 706 radio for Christmas, but have received reports of low audio. Using the instruction manual directions, I tried to set mic. gain using the ALC meter function. I was unable to get a reading. I then screamed into the mic. with the gain set at 10 and just got the bottom LCD element on the ALC meter to light. Needless to say this makes it difficult to even think about setting levels in the compression mode.
I took the unit back to the store and got the old story of, "you're the only one complaining of this problem." I did get the local tech. to check other new units in the store and they had the same problem. Anybody else unable to get a decent ALC reading out there?
By the way--I was asked if I had the radio hooked up to a good power supply and was I using the stock ICOM microphone. The answer is yes to both.

6264. FT-900 & FT-900ATs ARE LEMONS

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-27 00:00:00 UTC
From: THORNTONRP@nisewest.nosc.mil
Message-ID: <1995Dec27.224228.24047@nosc.mil>
Source record: 208158

Hello Bob,
I read your e-mail report on the internet. I concur. I bought a brand new FT-530 dual band UHF/VHF handi-talkie and FT-900AT transceiver from "Squeak" AD7K at Amateur Electronic Supply (AES) in Las Vegas in October 1995. First of all, the FT-530 worked like a champ. So I said, this YAESU stuff works like their reputation indicates. Immediately I called "Squeak" AD7K at AES and ordered the FT-900AT. I envisioned using the FT-900AT after I retire shortly in my motor home. Not anymore its back to the old reliable Kenwood TS-520 transceiver. I better buy some more 6146 tubes before they are all gone.

The first thing that I noticed when the FT-900AT arrived was that because of the lack of an RF gain control the background noise was objectionable. The IPO and ATTN controls lowered the signals but the background noise remained objectionable. If you like to "ragchew", where you turn the RF gain down so that the pure audio comes through, then forget it when using the FT-900AT. The problem with the FT-900AT is that it is run wide open, so even if you attenuate the RF front end, the IF stage is still pumping out noise. In the "old days" when you reduced the RF gain you at the same time reduce the IF gain.

The second thing that I noticed was that the Noise Blanker did not work for any kind of noise. I contacted YAESU's Customer Service and complained via telephone and via letter. They did not seem concerned. "Could this be shades of a Kenwood style attitude creeping in." I stated that my Kenwood TS-520 which I also use in my motor home puts the FT-900AT to shame. The TS-520 is quiter with equal sensitivity and the audio is absoutely superb (stereo quality) when you reduce the RF GAIN control. Additionally, the Noise Blanker works too. I asked the YAESU Customer Service representative if there was a way that the useless SQL control could be switched via hardware/software to control RF gain. I stated that if this radio was supposed to be the same as the FT-890AT which has an RF gain, why doesn't the FT-900AT have one. His reply was that they ran out of space on the control head. So I said how about providing me with a schematic of the FT-890AT, maybe I'll be able to modify my SQL control to an RF gain control. He stated that would void the warranty. Big deal, I am back on the TS-520 anyway. The $1300 FT-900AT makes a good short wave and broadcast receiver but not a good ham transceiver.

You can bet I'll never buy another YAESU product. Just think, I had an ICOM IC-706 new in the box and I sent it back to AES in exchange for the FT-900AT. El Stupido mi! Pass the lemon juice please.

Rubin
WB6ELM

P.S.
Are there any FT-890AT owners out there that can send me a copy of your schematics?
Does the Noise Blanker work on the FT-890AT?
Does the RF GAIN control reduce the background hash to allow clear audio reception on the FT-890AT?
Does anyone have a fix for this FT-900AT piece of junk?

While I was back in the old home town over Xmas
I was rummaging around in the attic and found a Knight Kit
that I had built back in the 50's. I was wondering if
there was anyone out there who remembers the 12-in-1
Electronic Lab Kit. The kit consisted of a particle
board base about one foot square. On the left side
was the power supply and a 12K5 tube under a perforated
cover. The rest of the board had three terminal strips
mounted an inch or so above the board. Various electronic
components were mounted between the strips and could be
interconnected by soldering wires in appropriate places.
There were terminals for an antenna, mic, earphones and ground.
There was a hand key in the right front corner and a volume
control and variable capacitor along the front edge.

There were 12 projects to wire including an AM
transmitter that put out a signal on the AM broadcast band.
I seem to remember a photo-electric project and a morse key
also. I had a ball with it at the time.

I was unable to find the book that explained the
hookups. It is probably long gone. I was wondering
if anyone else remembers this and perhaps might even
have the book. I sure would appreciate a copy of it.

Happy New Year!

Dave Smith WA1UWU

Enno:

In reference to your query, for a circuit that will
provide an RS-232 interface to your ICOM IC-706 radio;

Do you have access to the magazine "QST", the monthly
publication of the American Radio Relay League (ARRL)?
There have been at least three articles, since about 1991,
that provide interfaces that can be used with ICOM radios.

The simpliest interface uses 5 or 6 transistors, a few
resistors, a few capacitors, perhaps a diode or two, and
it takes power from the transmit data line coming from the
computer, using the negative going data transisitions to
charge up a capacitor to provide the negative voltage for
the RS-232 signal going into the radio.

The other articles use either the MAX232 chip (which has its
own on-board negative voltage supply), or the MC1488/1489
chips, which need a source of negative voltage to work.

I have an IC-706, and am planning on building my own
interface, following the first example that I've given.

Please let me know if you need actual schematic information.

AT&T is busy installing PCS equipment licensed for band A 2GHZ and Narrow band 940Mhz at a public facility I work at. Review of their specifications show a singular T1 driving the installation. Range on a line-of-sight installation in open terrain with antenna HAAT around 100', the effective coverage zone is 1 mile. Getting into 2 miles puts you deep into the roll-off zone. The facility has several buildings with several floors and configurations. Due to presence of public, ERP is being limited to around 150W. (About 6-10 Watts at the Amp)
[Look Ma, This plastic dome is a magic sun lamp]

I dont think we'll be seeing ethernet data rates on any publicly offered PCS net with these kind of specs I'm reading through. I think their target market isnt the heavy video conferencing crowd they play it up to be. Most lines will service digital cellular telephony.

Cheers

6274. Kenwood R-599D Receiver?

Newsgroup: rec.radio.amateur.equipment

I recently picked up a Kenwood R-599D (Or maybe it is R-5990). It has space inside for two converters - 6M and 2M.

Anybody have either of these converters for sale?

Also, I might be interested in picking up the matching transmitter (it transceives with it).

Also need a manual.

Anybody??

What you smell is molecules "evaporating" from the radio. That is why the smell will eventually disappear by itself, after most have naturally evaporated. You can help it along considerably:

After you wash it as well as you can using the methods already outlined by the other guys responding to your post before me, help the remainder evaporate by using mild heat. You can place it in a box in the sun on a warm day, inside a car with the windows just cracked a half-inch, inside my South Carolina attic any day in July, or some similar way to heat it moderately for several hours, while allowing the evaporated materials to escape. If you can smell the odors after the first evaporation, repeat it once or twice.

Don't get cocky and put it inside your kitchen oven, though - the temp is not well controlled and you could ruin the plastics in it. You might be able to use a hair dryer inside a box for this, if you are careful and can monitor the temp. I would keep it down to temps that humans can tolerate - like up to about 120 degrees F.

When buying New/Used equip from Frank be sure you
perform an operational check on the equip. Be sure
and verify that ALL of the options that he says are
"installed" are actually in the equip in question.

I bought a Icom V68 HT in which he told me the CTCSS
tone board was installed. I took his word as a fellow
ham. To my dismay, I later discovered that NO CTCSS was
installed!!!

When I contacted Frank he was very rude and told me that I
should have known better and that CTCSS was an option, not
standard. I knew that it was an option and specifically
asked if it was installed as the radio was useless to me
without the option. He told me it was installed!!!

Franks told me that If I wanted any refund that would have
meet him in Burnaby BC, a 6hr drive from my location. Not much
of a solution, eh?

So,take this into consideration if you are thinking about making
a purchase from Frank.

If the shop with which you are dealing is is fact a true Mother Motorola
dealer, then he should be ordering the manual for the software himself.
Look up the part number and order it. That's what I do when I want to find
Motorola information.

Albert Liao (liao@emedia.net) wrote:
: here's a question i've been trying to figure out:
: a lot of people claim they can hear AM transmissions through
: their dental work or bedsrpings. how does this happen? obiviously,
: the metalic structure of the dental work and the springs can act as
: antenna's but what is demodulating the signal from the carrier?
: and what is used to amplify the sound?

Any combination of a nonlinear device followed by a low-pass filter
(something slow) can demodulate an AM signal. Anything going down in a tooth
is not going to need much amplification- touch a piece of aluminum to
a silver/mercury dental filling and the resulting current going through the
nerve will be easily felt.
A double edge razor-blade makes a good demodulator. Electrically attach a
piece of graphite to a pin, connect the blade to an antenna and the other
end of the pin to one input of high-impedance earphones, with the other input
grounded and you can feel around on the blade for AM stations. The oxide layer
on the blade makes a semiconductor.

Tony: Did you check the following:

1) On the DTMF Keypad issue, it seems your radio is not seeing the DTMF Keypad. You DO have to enable it in the software. Each channel has to be turned on. This is done on the DTMF field not the channel programming.

2) As far as your side buttons, you can change the settings under side buttons. I don't have my notebook with me so can't walk you thru.

3) On the speaker mic jack issue, the speaker mic jac & radio programming are NOT related. If you noticed, you program the radio from the back. MAKE SURE THAT YOU PLUG THE SPEAKER MIC IN WITH THE RADIO IN THE OFF MODE. If you still have problems, recommend you send it in for service. Could be your mic jack went bad. There were some service memos a while back concerning the jack and a warning that you DO NOT plug any NON MOTOROLA Jacks in the socket. The Jack on the GP300 is very percise. We have found customers who have plugged in their own walkman type earphones and have damaged this jack.

By the way, if your friend is a Motorola dealer, he should know all of this. I have been associated with on since 1987 when RADIUS started.

73's and have a safe holidays.

6288. Re: Atlas 210X power output Question

Newsgroup: rec.radio.amateur.equipment

Source record: 208179
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I've found my Atlas 210 to be EXTREMELY SWR sensistive, so you might take a closer look at your 75 meter antenna.

I sometimes do 40 meter mobile with a Hustler 40 meter coil and a SWR around 1:1.5. My Icom 735 will put its full 100 watts into this antenna, but the Atlas 210 will drop to QRP levels, unless I have a tuner inline, then I get full power out.

Even though it is a little drifty on warm-up, has no CW sidetone and awkward CW TX/RX switching, I like my little old Atlas 210. I bought it from a newer ham for a mere 50 bucks, one of the best radio deals I've stumbled upon.

Source record: 208181

I have an IC-706 and have had zero problems with mike gain. I'm using the hand mike that came with it and an Astron RS-35m power supply. I just got the mike extender/converter cable and plan to connect my Heil to it (have to install a blocking capacitor first).

The only problem I ran into was my own doing. I couldn't get rated output to my dummy load on 6m. After much fussing, I realized I was sending the signal to my dummy load through the low pass filter that I have in line for HF work. It really works - lets very little 50 MHz enery through it. When I took the filter out of the line, I got full rated output.

From: draagen@forge.connectnet.com
Message-ID: <DRAAGEN.95Dec28060858@forge.connectnet.com>
Source record: 208183

I have a Heathkit HW-16 CW transceiver with the companion HG-10B VFO.
I also have the original manuals for said station. I'm planning on
putting it on the air soon.

What I'm lacking is an understanding of how to 'zero beat' the station
so that I'm transmitting and receiving on the same frequency. When I
begin operation, I'd like very much to be a good operator, but this
particular requirement isn't documented anywhere in the manuals.

Can you help?

From: David Negaard <draagen@connectnet.com>
Message-ID: <30E2B4CF.5D58D06B@connectnet.com>
Source record: 208186

Out of curiosity, where does one obtain replacement tubes for such 'vintage' hardware? I _suspect_ that a tube or three might be less than perfect with this stuff, and in any case think it wouldn't be a bad idea to lay in a set of spares.

Tubes needed include:

QTY	DESCRIPTION
1	12AX7
2	6CL6
2	6EA8
2	6EW6
1	6HF8
1	6GE5
1	OB2
1	6CH8

On another note, the days of tube testers in every grocery store are long gone, I'm afraid, so where does one go to test suspect tubes these days? Inquiring minds want to know...

Well, I won this the radio at a computer show and I really don't know much about this sort of thing so I'm trying to sell it. It looks kind of small and is probably designed for use in a car. This is what it says on the box:

Military spec construction
High effiency, integrated die cast chassis and heat sink
Advanced track tuning (ATT) receiver
Alpha-numeric LCD display
31 variable power output levels
31 memories

The specs in the manual are as follows:

General

Frequency range: (Tx)144 ~ 146 or 148 MHz, (Rx)144 ~ 146 MHz or 140 ~ 174 MHz
Channel steps: 5, 10, 12.5, 15, 20, 25 & 50 kHz
Frequency stability: < +- 10ppm (-20 to +60C)
Mode of Emission: F3 (G3E)
Antenna Impendance: 50 ohms, unbalanced
Supply voltage: 13.8V DC +- 10%, negative ground
Current Consumption(typical): Rx: 600 mA, Tx hi/mid/low 12/9/5A
Operating temperature range: -20 to +60C
Case size (WHD): 160x50x180 mm (w/o knobs)
Weight: 1.5 kg (3.3 lbs)

Transmitter

Output power (hi/mid/low): 50/25/5W
Modulation type: Variable Reactance
Maximum deviation: +- 5 kHz
Spurious radiation: less than -60 dB
Microphone Impendence: 2k omega

Receiver

Circuit type: Double Conversion Superheterodyne
IFs: 21.4 MHz & 455 kHz
Sensitivity (for 12dB SINAD): better than 0.2 mu V
Selectivity: (-6/-60 dB): 12/30 kHz
IF Rejection: better than 70 dB
Image Rejection: better than 70 dB
Maximum AF Output: 3.5W into 4 ohms @10% THD

Accessories

FTS-17A CTCSS Unit
FRC-6 DTMF Pager Unit
MH-26g8j Hand Mic w/ Burst
MH-27a8j DTMF Keypad MIC
SP-7 External lounspeaker
FP-800 AC Power Supply

The radio is brand new. It's never been used and it includes all manuals, warranty cards, etc. I've been told that this thing retails for about $400 so I'm asking for $275 (willing to compromise). You can contact me at ctompkin@infi.net

: Austin Amateur Radio is a must call when shopping, and I can tell you, I
: have always had the best deal from them.

I have never dealt with AAR before, but will probably call them for a quote on an IC-706, along with Oklahoma Comm Center.

There was a similar thread on this newsgroup a few months back, where there were numerous complaints about the attitudes of salespeople at both HRO and AES, experienced by walk-in customers.

However, I have bought quite a few items since from HRO, visiting their stores in Anaheim, Burbank and San Diego. I have never been treated any less than I would expect on any visit. One of the salesmen at HRO-Anaheim even held on to his last antenna of the type I wanted, until I visited the store two days later, with just my word that I would be there to buy it.

Last time this thread went around, someone suggested that the attitude of the customer could have something to do with the problem. Not to accuse anyone here, but this is something to consider.

When buying New/Used equip from Frank be sure you
perform an operational check on the equip. Be sure
and verify that ALL of the options that he says are
"installed" are actually in the equip in question.

I bought a Icom V68 HT in which he told me the CTCSS
tone board was installed. I took his word as a fellow
ham. To my dismay, I later discovered that NO CTCSS was
installed!!!

When I contacted Frank he was very rude and told me that I
should have known better and that CTCSS was an option, not
standard. I knew that it was an option and specifically
asked if it was installed as the radio was useless to me
without the option. He told me it was installed!!!

Franks told me that If I wanted any refund that would have
meet him in Burnaby BC, a 6hr drive from my location. Not much
of a solution, eh?

So,take this into consideration if you are thinking about making
a purchase from Frank.

Don-- Your friend's FT-23R also needs the optional CTCSS tone board
installed. I forget what the model number is from Yaesu but you'll
know whether the board is in or not by pressing the "F" and then the
"T" button. If you don't see a tone frequency displayed, the board is
not installed.

Just to add my 2 cents worth...

We live in Austin. I have bought 3 HTs from Austin Amateur Radio Supply as well as the usual fare of cables/coax/connectors/books. My experience has been that one of their staff members is friendly and the others are 'in business'.

My wife surprised me this Christmas with a *pair* of Cushcraft A270-10S beams. She bought them at AARS. She also told me that she never wants to go there or let me spend another dollar there again because no one was WILLING to help her make her selection in any way. She is not a ham, but she is not a dummy either (she has a Master's in Applied Math...)-She just didn't know enough to make an informed selection. She DID know that I wanted to work satellites on 2m and 70cm and that I wanted a pair of beams for circularly polarized signals.

It would seem good business to at least make suggestions or talk about the options available. They didn't even tell her which manufacturers or models would meet her stated needs. They told her that she would have to give them a part number before they could "help". She was in person in the store twice! They didn't even offer her a catalog to help.

These guys are in a business which 'feeds' on a hobby - pure and simple. An eager to assist - let's have fun - type of attitude would seem to be a good approach. Maybe they need competition closer than Oklahoma/Ohio/etc.

...for what it's worth...

73s and happy shopping

6323. IC706 SWR METER

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-29 00:00:00 UTC
From: fitr%mimi@magic.itg.ti.com
Message-ID: <4c0886$6is@tilde.csc.ti.com>
Source record: 208067

Hi,
Any Icom 706 owners out there care to comment on the internal SWR meter? I have the following questions that a copy of the manual were unable to answer:

1. What is the minimum power output to get an accurate VSWR reading?

2. By reducing the rig's power output, does the SWR meter "sensitivity" need to be readjusted internally or is the VSWR auto-computing?

Dont own one of those rigs, but was curious none the less. Could someone try running the rig, say at full output into a 2:1 SWR and then reduce power to 20 or 30 watts and confirm the SWR reading via the LCD meter is still 2:1? I've found that most internal SWR meters are "calibrated" based on full output power, and as forward power is reduced, the SWR meter accuracy declines rapidly. Since SWR is a simple ratio, the SWR meter reading (in theory) should not change regardless of power output.

Appreciate an email response -- current newsreader stinks. Thanks!

Joe

Source record: 208068

I have been using a TS830S for years and I still have it. I consider it one of the best buys available. A great radio for the money. CW filters are optional and the best choice is two 500 Hz filters, one in each IF. Also, I have never seen this written anywhere, but the VFO120 External VFO that is usually sold with TS120 and TS130 rigs plugs right into the TS830S, is much smalller than the external VFO normally recommended for the TS830S, and much cheaper, too. I use one with my TS830S.

While I have only had one experience with the Austin store that was disagreeable (buying a FT530 a couple years ago, I got a "They came in the back door and went right out the front door...no, I don't know when we're getting more, but they're spoken for anyway"--very rude), I have met so many people who have had bad experiences that I'm inclined to believe it. Yes, one staffer is a really nice guy, and the other one?...well...doesn't seem to be.

By the by, there *is* competition closer: K-Comm in San Antonio is a really nice store; the atmosphere is very relaxed and friendly, the guys there are more than happy to help you with anything you might need help with, even if you're not buying today, thank you very much. You can ask questions on equipment, and you'll get straight answers--and if they don't know, they'll tell you that, too. Real nice guys there; definitely worth the drive.

Most likely it was a PRC-90 (or a newer version), A small hand held carried by military flight crews. The PRC-90 xmitts on 243.000 MHz (the Guard or emergency frequency) and 282.800 MHz. It has MCW capibility and a morse code chart on the back cover. I believe it also has a beacon mode. It also had an ear phone that magneticlly disconnected the speaker. It was powered by a battery that was approx. the diameter of a "c" cell but was about 1 1/2 times in length. The battery dropped in and had a ring around it so it couldn't be installed backwards (Pilot proof? Hi!). They are water tight to 10 PSI (we would drop them in a water tank and pressureize them).

Don't quote me, but I think the power output was 5 watts... it may have had a low power mode but I'm not sure.

I used to work on them (and other stuff) when I was in the navy.

Hope it helps

de Glenn

P.S. It might have been water tight to 15 psi... it's been a while

6328. A radio you can sit on. AM reception in your ....!

I think I can top the AM in your teeth stories.

One of the strangest such stories I have ever heard involved local ham operator back in the days that many hams ran high powered AM. He had just put his kilowatt of AM on the air and got a call from his neighbor who reported that he was hearing the ham coming out of his toilet.

The neighbor finally convinced the ham to put his wife on the mike and he went over and sure enough, a distorted, but recognizable voice was coming out of the toilet.

They ended up pulling the stool and found a number of razer blades that someone had disposed of in the toilet.

I wonder what the neighbor would have thought if he would have heard the old ham expression "You're splattering old man?"

ICOM IC-706 HF/VHF AMATEUR RADIO TRANSCEIVER
Product Review, Hints and Tips, and Modifications
As Of: December 28, 1995
by Randall Rhea, KG0HW

OVERALL IMPRESSION

"Too good to be true". This was my understandable reaction to Icom's announcement of the IC-706 amateur radio transceiver last summer. It looked like my dream mobile rig: very small size, detachable face plate, all HF bands, FSK, 6 meters with 100 watts ... AND 2 meters, all in one rig? It sounds too good to be true, but after using this radio in my car for about a month, I can tell you that this radio is real. Although the rig is not without its faults, Icom has produced an innovative masterpiece. The rig does just about everything as advertised. It is an easy-to-use radio that replaces several other radios that I was operating in my car.

Over the Christmas holidays, I took a couple of long car trips here in Texas. The 706 was installed under a car seat, leaving plenty of room for luggage and packages. (Do NOT block the top of the rig. Leave room for air circulation. The rig gets VERY hot when transmitting!) The face plate was installed just below the dash within easy sight when driving. I used headphones, so my wife and daughter could listen to CDs while I was working DX. The headphone plugged into the face plate. I used a 7-foot whip mounted on the trunk of the car tuned for the SSB portion of 6 meters, my favorite band. The radio was a pleasure to use, even while driving.

During a nice opening on 6 meters on the evening of December 27, I worked several new grid squares in the midwest and Arizona. I also worked North Dakota for the first time. I was able to work a station in Mexico City quite easily, despite the pileup. That 100 watts sure helps. (I previously used a 10-watt rig.) The sensitivity of the receiver, although not quite what the "pros" would want, was quite adequate. Noise from the car engine was only a minor problem; the noise blanker was effective for SSB.

During the trip I also listened to a football game on TV channel 2, listened to truckers' traffic reports on CB channel 19 (27.185 MHz), worked a couple of 10m stations during the sporadic E opening on December 27, worked a couple of 20m stations, listened to WWV on 2.5, 5, and 10 MHz, eavesdropped on some interesting baby monitors and cordless phones on 49 MHz, listened to NOAA weather forecasts on 162.55 MHz, monitored some aircraft traffic, and did some ragchewing

on 2-meter repeaters. Not bad for ONE radio!

PRICE

I paid $1249 for mine at Tucker Electronics in Dallas. They told me that they have sold about 200 of them in six weeks, making the IC-706 their best selling rig of all time. They are getting them from Icom in lots of 20 and are having trouble keeping them in stock.

Prices for accessories are pretty high. There is little profit margin in the box, so they make up for it with high accessory prices. The cable to allow for front-panel detachment is $48.

UNIQUE FEATURES AND INNOVATIONS

See

http://www.icomamerica.com/icom/amateur/hf/#IC-706

for a list of features.

* The smallest HF rig on the market (similar in size to the Kenwood TS-50)

* Detachable face plate with a jack for a speaker or headphone. The mic plugs into the face plate using a plug similar to a modular telephone plug. (A spare plug is included.) The cable to allow for this detachment costs extra.

* Full HF/VHF transmit coverage from 1.6 to 54 MHz and 144-148 MHz (the rig transmits only on the ham bands out of the box, but an easy modification unlocks the transmitter, see below)

* General coverage receive from 50 KHz to 163 MHz (requires modification, see below) Rig receives up to 200 MHz but with poor sensitivity above 162 MHz even with the modification. You will be able to receive: longwave, AM broadcast band, shortwave broadcast, all amateur bands in all modes from 160m to 2m, FM broadcast band (wide FM), aircraft (118-136 MHz AM), VHF from 30 MHz to about 162 MHz, US TV channels 2 through 6, NOAA weather at 162 MHZ.

* 6 meters and 2 meters, all-mode

* 100 watts on HF and 6 meters (10 watts on 2 meters)

* Innovative, easy-to-operate menu system. It becomes quite easy and natural to use after reading the well-written manual for about an hour. (In contrast to my Yaesu FT-470 HT, which I still cannot figure out.)

* The manual is very well written, with lots of easy-to-understand diagrams.

* Simple, but useful and configurable band scope. (Previously available only on very expensive rigs like the Icom 781.) This

allows you to examine nearby frequencies for activity.

* Split frequency operation appears complicated at first, but the rig's "quick split" mode makes it fast and easy.

* Built-in electronic keyer at no extra charge. The Up/Down buttons on the mic can be used as a paddle. This has rejuvenated by interest in CW. I worked a couple of slow CW stations on the novice portion of 80m, which made me remember how fun CW is.

* FSK (Nice feature for this price range)

* DTMF and programmable offset for repeaters and split frequency work

* Good audio reports from contacted stations. A station on 3.85 MHz reported "a very good signal for a mobile". A 2m FM station reported "very good audio ... so that's the 706 I've been hearing about."

* Works very well with the AH-3 antenna tuner. This is the Icom HF (1.8-30 MHz) random wire tuner that worked with the 725. The tuner is mounted under the trunk lid of my car with cable ties. It can also be mounted outdoors. It will tune any 8-foot whip or wire for any HF band. (You need 40 feet for it to tune to 160m.) You can press a button to enable the tuner, or the tuner can fire off automatically if your SWR is too high. With my 7-foot 6-meter whip, I can tune to any HF band above 3.5 MHz. That means I need only one simple antenna for HF and 6m.

* 100 memories that store frequency, split offset, mode, and FM tone.

* Two antenna connectors: one for HF/6m and one for 2m. The connectors are switched at 60 MHz.

* Jacks for remote speaker and/or headphones on both the face plate and the back of the rig.

* Multifunction meter: S meter, SWR, relative power output, ALC.

DRAWBACKS/FLAWS

* Extended VHF receive requires modification (see below).

* Poor sensitivity above 162 MHz.

* Noise blanker does not work on AM. Very irritating pulse noise on AM while the car's engine is on. The blanker works well on other modes (except FM, where it is not needed). Not good for listening to AM while driving. A rather serious flaw in my opinion, since my $40 CB has a noise blanker that works well.

* Poor QSK (full break-in) capability. Not recommended for high-speed CW operators who want QSK. Use semi-break-in instead.

* No CW narrow filter. You can install one as an extra-cost option or use an external CW filter or DSP unit.

* The built-in speaker provides surprisingly good audio for its size, but you will probably want to use an external speaker. The speaker can be connected to the face plate or to the rig itself.

* Automatic repeater offset is not programmed into the rig. You need to program -600 or +600 yourself through the menu system. This is not a problem if you store your favorite repeaters into one of the 100 memories.

* The S-meter is inaccurate below S9. Above S9, it is quite accurate.

* High prices for accessories (typical of just about all other vendors)

* The AH-3 antenna tuner is shipped with an unshielded cable, which picks up a lot of auto engine noise. You need to make your own shielded 4-wire cable. The AH-3 also blocks signals above 54 MHz. It also only works for HF, not for 6m or 2m.

* Expect performance and receiver sensitivity similar to other rigs in this price range. This is a low-end rig in terms of price. For price vs. performance, this is probably the best amateur radio of all time. However, it will not outperform your $4000 rig. You probably won't win contests with it. You will have a lot of fun and own a nearly ideal rig for mobile work.

HINTS AND TIPS

1) Take time to read the manual. The menu system will be bewildering unless you read the manual. One you get used to it, you will find the rig to be amazingly easy and fun to use.

2) You need to set the mode to wide FM to receive FM or TV broadcasts. Tune to the station, press the MODE key until the front display shows FM, then press and hold the MODE key for 2 seconds. WFM will appear in the display, and you will hear the station with nice audio.

3) Don't use the noise blanker on AM. It will not be effective and may distort your audio.

4) Don't use the QSK feature.

5) The rig gets very hot while transmitting. Keep the top of the radio clear to allow air circulation.

MODIFICATIONS

WARNING: Improperly performed modifications can severely damage your radio. I have performed these modifications successfully, but I offer no guarantee or warranty for them. Proceed at your own risk.

TOOLS NEEDED:

1) Small philips-head screwdriver 2) Tweezers 3) Magnifying glass 4) Low-wattage (15 watt) soldering iron 5) Long-nosed pliers

MODIFICATION 1: Enables out-of-band transmit for 1.6 MHz to 54 MHz. This does not enable extended VHF transmit; a modification for this may be available soon. This does not enable AM or FM broadcast band transmit. Your memories will be cleared after this modification, since you need to reset the CPU.

1) Open the top of the radio by removing the 3 top screws and 2 side screws. Look at the radio from the with the front panel facing you. screws.

2) Gently pull up the speaker and set is aside without damaging the speaker or the wires that attach it to the rig.

3) Note the silver rectangular box near the middle of the PCB marked something like "9 MHz SSB Filter".

4) Move your eyes up from this filter toward the back of the radio. Just before you get to the "D 108" marking, you will see two tiny diodes, two blank spaces, and one additional diode. They look something like this:

D108

[XX] [XX] [ ] [ ] [XX]

Remove this diode ^^^^

5) The second diode from the left needs to be removed. I did this by crushing it with long-nosed pliers. You can also heat it with a low-wattage soldering iron and pull it up with tweezers. Be sure not to damage the other diodes or the PCB. Be sure that you don't apply too much heat, since the heat can damage the PCB and the other diodes.

6) Re-assemble the radio. Reset the CPU by pressing and holding down the UP and DOWN buttons on the front panel and pressing POWER.

MODIFICATION 2: Enables more sensitive transmit above the 2 meter band. (148 to about 162 MHz; after that, sensitivity drops off.) Keeps sensitivity for the FM broadcast band.

1) Open the top of the radio by removing the 3 top screws and 2 side screws. Look at the radio from the with the front panel facing you.

2) Note the silver rectangular box near the middle of the PCB marked something like "9 MHz SSB Filter".

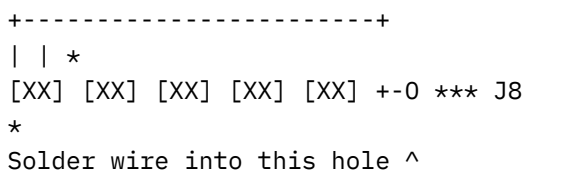
3) Move your eyes up from this filter toward the back of the radio. Follow the ribbon cable up. Notice a wide white connector with several colored wires in it on the back of the PCB.

4) The fourth wire from the left is a yellow wire. Cut this wire. Rather than cutting it, you can remove the connector, stick a paper clip in the side of the connector under the wire, push it in, and pull the wire out. Be careful not to remove the other yellow wire.

5) Re-insert the connector back to its original place on the PCB.

6) Open the bottom of the radio. You will again need to remove 5 screws.

7) Look at the radio with the front panel facing you. Note 5 tiny transistors behind the MENU button. Follow the trace from the middle transistor to a hole just to the left of jack J8.



8) Solder a small wire into this hole. Be careful not to apply too much heat; use a low-wattage soldering iron. Be careful not to damage the PCB or the grey cable coming out of J8. Use a magnifying glass.

9) Run the other end of the wire you just soldered to the front of the radio and attach it to the yellow wire you just cut.

10) Re-assemble the radio.

>both.
>AA8MX

My IC 706 behaves the same way with the stock mike. If I turn on
the speech compressor, I can get ALC indication. There is also
the comp. setting pot on the side of the radio that you can
adjust. With my SM-8 Icom mike, which has a pre-amp, the radio
works fine. The stock mike has no pre-amp, that I am aware of.
I think the mike is some type of noise cancelling mike for mobile
use.
It seems to work fine with the comp. on, so you may have to leave
it on all the time.
Another thing I found, is to set the carrier point (menu
accessable) at around -130 or so. It makes for much richer
sounding audio, although it won't do anything for your ALC.
All in all, I am extreamly happy with my 706.

I have a Yaesu FT-5200 that uses this module in the 2 meter
final. The module is now defective after about 2 years of use,
but what got my attention was that I saw another ham selling
the same rig with the same problem about two weeks ago.
It's a pretty expensive component - almost $100 at RF parts.
I'm inclined to take issue with Yaesu over this defect,
especially if it's widespread. Comments??

I have 2 of them and REALLY like them.

* Excellent transmit audio
* Small
* Light
* Backlit keypad and display
* Easy to program
* Used for packet with no problems
* Larger display (for a small ht) that is easy to read
* [#] [B] while turning on opens up receive to something
like 108 to 799
* Weather channels are built in, so you don't need to
use up memory channels for the weather channels.
* Battery gauge is useful for checking batttery level,
especially if checked during transmit.
* Extra low power (15 milliwatts) helps save batteries
when you don't need extra power. I was surprised how
often I could use the extra-low power setting.
* Memories can be labeled with text.
* encode/decode/page
* shipped with a pretty decent antenna, you don't need to
run out and replace it with something that works.
* Decent audio for a small ht. In a loud car or truck you
might want to add an external speaker or use the adapter
RS sells to use the cassette player in your car.
* Good scanning options, including the ability to save 3
scan ranges.
* Backlight can be turned on perminantly (nice when using
a power supply other than the battery).

>

I have used the Radio Shack DSP unit. Its main advantages are low price
(on sale now at $49.00) and ease of use.

It works well as a narrow filter for CW and a heterodyne (squeal)
reducer for SSB. For AM, it can reduce heterodyne noise, which is
especially helpful for CB. It does not reduce other noise (e.g.
car engine pulse noise) and can reduce the quality of the AM signal.
The processor is a bit slow.

The cheapest and easiest way is to buy any kind of insulated wire (the
cheap stuff will work fine) and string it around the room or on the roof.
Strip one end of its insulation so only the copper wire shows, then attach this
end to the antenna of the radio, and you will get greatly improved
shortwave reception.

Another option is to buy an active antenna. This is a small box with a
telescoping whip and some sort of tuner box. You can get one at Radio Shack
or one of many stores that sell shortwave radios.

6347. Using HP8690 with HP8410 Network Analyzer ???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-29 00:00:00 UTC
From: nx7u@primenet.com
Message-ID: <4c1moh$a1d@nntp3.news.primenet.com>
Source record: 208091
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

The HP8410 Network Analyzer documentation specifically mentions the HP8620C as the sweeper of choice, even coming from the factory (at the time) with a control interconnect cable for the '8620.

Does anyone have any insight on if and/or how an HP8690 can be used as the sweeper in an HP8410 system??

Thanks in Advance,

Scott Townley

Scott,
Sounds like you finally got that 8410 that you were looking for
earlier this year. Yes, you can use the 8690 as a source. According to
HP App Note 117-1, the only requirements for the sweep oscillator for the
8410 are:

1. RF Output - -15dBm to -6dBm.

2. Spurious signals should be at least -20dBc from the
carrier.

3. Sweep Characteristics: Uniform sweep rate that is variable
from 15 to 150 MHz/mSec. In addition, it is important that
there be at least a 3 mSec pause at the start frequency
prior to each sweep to allow the 8410 to attain initial
lock.

4. Phase Lock: To improve phase-lock operation at high sweep
rates the oscillator should furnish a voltage proportional
to its output frequency.

I've got a whold bunch of literature on this monster if you're ever
in need. Still owe you for the Ham Radio photocopies.

The term 'boatanchor' covers a variety of amateur radios and communications receivers from the vacuum tube era. Certainly would include the SX-101 and HP-608.

I would also include in the category much of the very early solid state communications / ham receivers such as the Davco DR-30 and Hammarlund HQ-215 (both of which are in my 'boatanchor' gear). I would also include sets such as the SBE-33, -34 - mixed solid state / tube technology.

6355. Need Advice on Kenwood T599D Transmitter

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-29 00:00:00 UTC
From: blanton@ni.net
Message-ID: <blanton-2912952328040001@xband.ni.net>
Source record: 208099

I�m becoming an active amateur again after a long dormancy and am looking to set up a basic HF station. I have a good receiver so I�m shopping for a used transmitter or transceiver to get on the air. My basic preferences are that it cost roughly $200 or less, cover 80-10 meters and be all or mostly solid state.

One of my candidates is the Kenwood T599D transmitter from the mid-1970s, which is solid state except for 3 tubes (presumably the driver and finals). Has anyone had any experience with this unit (good or bad)?

Other candidates are the Heath SB-104 and Atlas 210 transceivers. I know that the Atlas 210 is VSWR-sensitive but can sometimes be acquired �real cheap� (maybe the reason?). I�d appreciate any comments or advice, either via e-mail or this newsgroup. Thanks in advance.

The IC720a needs a few mods in order to work on amtor.

The following is from the ICOM newsletter 35 of June 83, article by Roy Philpott DJ0OW, G3VCH.

Quote: All mods are to the main board, easily accessible on the top of the set. The modification consists of replacing C42 and C43 with 1uF. Also replacing C40 (1uF) with 0.47uF. This effectivly shortens the T-R switching, also it is necessary to remove the AF amp mute by placing a shorting link across C69 (there will be audio present on normal operation, but it doesn't cause a problem).

I did this mod when I had an IC720a and it worked fine with an AMT-1 terminal on "SSB" mode.

I like to play with and refurb older synthesized radios.

I am looking for ICIR, Cubic, Atlas, Swan (MX), Signal One, and any other
older synthesized solid state or hybrid radios and the accessories sold
with them. I'm also looking for any literature or photocopies.
I'm not a 'collector' so the stuff needn't be pretty. I prefer dead as
I like working on em and I can more easily afford dead :-)

I'll trade $, computer parts, other radio stuff, radio repair (on the
ones I like).

I am also looking for a Mosley CM-1 receiver (tube radio)
and anything by Geloso or American Geloso (all I know of theres is tube
but if you know more, talk to me :-)

Scott,

My 8410 manual is apparently older than yours, and has instruction for using the 8690. I recently aquired the latter, but haven't had a chance to fool with them yet. If you send me your address, I'll copy the relevant manual pages pages and send them to you. I could also fax them if you would prefer.

Cheers,

Jon

>I used a Shure SM-58 (150 ohms) with my TS-820 and I just wired it >direct with no problems.

There shouldn't be. A 150 ohm source impedance microphone can be used with either a low or high-Z input stage. The high-Z input stage circuits "bridge" the low source impedance of the microphone.

>Just think, I had an ICOM IC-706 new in the box and I sent it back to >AES in exchange for the FT-900AT. El Stupido mi! Pass the lemon juice >please.

If you hadn't made the exchange, the content of your letter would still be the same, only you would be describing problems with the ICOM 706.

Unfortunately, compromises must be made with these small radios and everybody wants FT-1000-class radios with all the features in a small package.

Aside from the RF gain control, what other problems did you have. Prior to making the exchange, didn't you ask someone, check out a product review, or look at the front panel in a product literature pack?

Living language is an evolving thing, but I would be hard pressed to use the term "boat anchor" for early solid state rigs. I do think that they are nice collectables and make excellent restoration projects, but I would balk at the term boat anchor. But then I'm an old geiser, so what do I know?

BTW, I have a Sears optically tuned 2-Meter FM tranciever that I still use occasionally as a spare rig. I only wish I hadn't drilled holes in the case to mount it when I first got it though.

Last year at the Georgetown, TX swapfest there was a yellow pickup truck with a sign that read "Boat Anchors; Make Ofer." When I walked over there, I saw that he had a bunch of small anchors that he had collected while diving the previous summer. I thought it was just a little humor, but the guy sold them out and was using the cash to buy ham gear.

73 from N2YRW

I have the following computer system available for sale; it is
particularly suitable for Packet Radio, phone BBS / Internet access,
and overall personal computing needs.

Computer hardware:
==========
Home built 486 computer with hand picked components:
- Mini-tower type case with 200 Watt power supply,
- Micronics motherboard with Intel 80486-DX processor @ 33 MHz,
64 KB processor cache, 7 ISA slots, 8 x 30 pin memory sockets,
- 4 MB system memory (4 x 1MB - 30 pin - SIMMS with parity),
- 200 MB hard disk drive,
- 5-1/4" floppy disk drive,
- Single speed CD-ROM drive (caddyless)
- Hard disk, floppy disk, CD-ROM drive controller,
- 2 serial (RS232C) and 1 parallel (Centronics) ports,
- 14.4 Kbps data modem with 9.6 Kbps fax capability,
- Accelerated VGA controller with 1 MB video memory,
- 14" monochrome VGA monitor (paper white, razor sharp)
- Creative Lab's Sound Blaster - 8 bit sound card,
- 4 Watt capable desktop speakers,
- Keyboard,
- Genuine Microsoft serial mouse,

System and user softwares:
==========
- Microsoft DOS 6
- Microsoft Windows 3.1
- Microsoft Word 2.0 - word processor,
- Microsoft Excel 4.0 - spread sheet,
- Fax and communication software for Windows,
(All softwares come with original disks and manuals)

Packet Radio Hardware/Software/Litterature
==========
- Tigertronics Inc's BayPac Packet Modem (Model BP-1) 1200 baud,
- Connection cable for Kenwood TH-78A,
- Original BayPac software,
- "Your Packet Companion", 170 page introduction book to
packet radio.

Everything is in mint condition with extensive documentation.

Complete package for $895 + shipping
Call 718-544-7547 or email to:

WINDOWS'95 UPGRADE CD AND MANUAL
==========

My Cardiologist office has merged his 3 offices with 2 others and has purchased all new computers and upgraded software for all the offices. His software provider will not guanrantee the perfomance under Windows'95 so he is not upgrading past Windows 3.1

He has given me all the upgrade packages that were sent to him after his purchase. Obviously I can only use 1 package.

I have for sale the extra Windows'95 Upgrade Kits. These are CD-ROM Upgrade kits. They are sealed Microsoft Upgrade kits with the Microsoft Certificate of Authenticity, holographic security label, etc.

The price is $ 50.00 including shipping.

Contact Bob Reed, WB2DIN, at (908) 363-2724 any time until 2300EST daily.

6377. Remote mounting dual band mobiles

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-30 00:00:00 UTC
From: ken@marconi.w8upd.uakron.edu
Message-ID: <4c3p73$1n0@kira.cc.uakron.edu>
Source record: 208023

I am contemplating the purchase of a dual band mobile rig, but I can't decide which model I want. I would ideally like to be able to separate the microphone connector from the control head when I remote mount it.

Although I know the Kenwood 732 and 733 rigs will do this, I can't tell from the photos or other specs whether the alinco radios or yaesus will allow mounting the mic connection somewhere other than on the control head.

Anyone have any suggestions?

Tim,

A friend of mine has been able to get it work using the following information.

==========

Subject: Expanded RX and TX range for the ADI AT-200

130-163.995 mHz

Date: 6 Oct 95

NOTE! The first step is the microprocessor master reset and will erase ALL memories.

1) While pressing the Function button (F), turn the radio on. Display will show all figures. Release the (F) button and it will read 145.00.

2) Turn power off.

3) Press 3 while turning power back on. Display will read 145.00 again.

4) Press F and 3. Display will read 10. Change STEP to 05 by turning dial one click.

5) Press F and 9. Display reads 00.60. We are now going to change it to 30.63 [50].

6) While pressing the F button, rotate the dial knob about 10 clicks counterclockwise until the display reads 30.60. Release the F button. Rotate the dial clockwise about 7 clicks until the display reads 30.63[50].

7) Press F and 3 and change STEP back to 10.

8) Press F and 0. Display reads 145.00.

9) Press 7. Display reads . (period)

10) Press the numbers 3 0 6 3.

11) Press *. Display reads 130.00.

12) Press F and 9. Display reads 30.63[50]. Hold the F
button and turn the dial clockwise about 10 clicks until
display reads 00.63[50].

13) Release F button. Turn dial CCW until it reads
00.60.

14) Press *. Display reads 130.00.

15) Turn the radio off and then back on again. This
restores the keyboard direct frequency entry feature.
The modification is now complete. The radio will now
receive and transmit from 130.00 to 163.995. Hint: Use
the F and Mhz buttons to make large frequency changes.

==========

This information was downloaded from ftp://ftp.qrz.com/mods

BTW (for all you law freaks who love to flame)
-It is not illegal to posses radios capable of transmitting on
frequencies you're not authorized to use, as long as you don't transmit
on them.

Try going to your nrarest Radio Shack -- They may have the manual, and if they don't, they can order it from customer dervices. You can also het a service manual for most Radio Shack products through customer service. Both service manual and operators manual should cost in the vicinity of $15-$20.

>have

>spoke to a friend who says the hardware is only about $25 for each radio

I haven't priced it out- but the Radius M100 line (which is 99.9%
similar to Maxtrac, esp in controls and cosmetics) only needs the
faceplate replaced to expand the memory (and a trip to the
programmer). NO other hardware is changed in the radios- so if Mother
Batwings were being reasonable $25 should cover a panel with a couple
of buttons, a 2 digit LED, a couple of LEDs (Tx and Rx indicate) and a
specialized ic to run it.

GE for a while made a series of mobiles that came from the factory as
2 channel radios- if you wanted more you replaced the faceplate.
Probably why a local 2-way shop has a box with 500 of these 2 channel
panels in it!!

>
>-Paul, N9AZ
>

My lo-Z mic attached to hi-Z TS820 did not work well. I had to
turn up the mic knob on TS820 to almost full volume and then
it would only modulate 20% of power yelling in mic.

I installed a 50K:1K audio transformer and the problem is almost gone.
At 2/3 mic volume, normal voice, I can modulate 60% of power. Its still
not quit enough, as VOX only opens if I yell into mic. Without transformer
VOX would not open at all. Good enough though, I can live without VOX.

I believe a lo-Z mic creates a low voltage signal with fair current.
I believe a hi-Z mic creates a high voltage signal with weak current.
The transformer pumped up the low voltage signal to a high voltage
signal, but with the loss of conversion due to K of transformer.

If voltage from lo-Z mic was equal to a hi-Z mic, no transformer
would have been necessary.
Note: Lo->Hi can be ok, but Hi->Lo won't work.

The Hallicrafters S20R was manufactured from 1939-45. Original price $49.95. Tube compliment is: 6SK7 rf, 6K8 converter, 2 6SK7 if, 6SQ7 det/avc/af1, 6H6 nl, 6J6 bfo, 6F6 af out, and 80 rectifier.

A good place to check for the schematic is your local library if they have the old Ryder books (similar to Sams Photofact).

Good luck ....

>DARK BLUE IN COLOR. A GREAT 6 METER 10 METER HF AM RIG!!!
>$150. PLUS SHIPPING FROM S. FLORIDA C O D ONLY. IT IS HEAVY. 14"X12"X6"
>WITH THE SAME SIZE POWER SUPPLY

The G-76 does not transmit SSB. It is AM/CW only. The power rating is 100W input AM (about 65-70W output) and 120W input CW (about 80-90W out). The final is a single 6DQ5.

The receiver is dual conversion with a first IF at 2065 KHz and a second IF at 262 KHz.

The VFO covers 80-10M but 6M requires crystals. These units also have an internal socket for an optional crystal calibrator.

charles1@netcom.com (charles copeland) wrote:

>I believe a lo-Z mic creates a low voltage signal with fair current.

Not always. Some low-Z mics have a considerable output voltage. The problem is, most of us don't know what the output voltage spec is - we only know it's labeled "low-Z."

>I believe a hi-Z mic creates a high voltage signal with weak current.
>The transformer pumped up the low voltage signal to a high voltage
>signal, but with the loss of conversion due to K of transformer.

A good audio transformer should have very little loss. This is sort of the same problem as above, only in reverse. Rigs aren't specified as to the required input voltage at the stated impedance, so there's no way to know what's required. They're all different, and your mic would probably work very well with some rigs, but not with others.

>If voltage from lo-Z mic was equal to a hi-Z mic, no transformer
>would have been necessary.

Perhaps. It's always possible that the frequency response of the mic is governed, in part, by the load.

>Note: Lo->Hi can be ok, but Hi->Lo won't work.

Again, depends on the type of microphone. A high impedance dynamic mic may be able to drive a low impedance input, but it's pot luck. You won't know for sure until you try it, and there may be frequency response problems. The latter is especially true with crystal and ceramic microphones, which should always see a high impedance load.

The best approach is to try to feed the rig with a driving impedance that's reasonably close to the specifications, and to terminate the mic with a load reasonably similar to its specs. This might not always work perfectly, but it the best chance you've got. :)

>is the normal cassette motor speed. All suggestions & solutions
>appreciated.

In order to double the speed, you will either need to replace the
motor or change the mechanical relationship between the motor and
capstan. While some reel/reel machines have used sleeves over
the capstan for this purpose, that may not be a viable option with a
cassette recorder due to space limitations in the cassette shell
itself. The only other options are to either install a larger motor
pulley or a larger flywheel. Neither is easy, although of the two,
having a custom motor pulley machined is the least difficult.

Once the tape speed is mechanically doubled, an adjustable voltage
regulator circuit can be used to reduce it as necessary.

This advice is offered relative to the typical DC motor-powered,
belt driven cassette mechanism. Other types, particularly direct
drive transports, those based on AC motors, or those that are
belt-drive servo-controlled, may not be readily adaptable.

6402. Variable Bandwidth Filter QST July95

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-30 00:00:00 UTC
From: "David B. Perrin" <d_perrin@conknet.com>
Message-ID: <c1d7cb$14120.27@news.conknet.com>
Source record: 208104

Hi;
I have put together one of the variable bandwidth filters from page 30 of QST, July 95. The filter works very well I think. It will sharpen to about 50 Hz or widen out to 3 KHz. It is not a notch filter but it certainly can get quite sharp.
The filter wants both plus and minus 5 Volts. One method suggests using two zeners in series with two low value resistors and applying 12 Volts to the ends of the circuit, and grounding the junction of the two zeners. Then the article says "be sure that the common (ground) line of the filter's PC board never meets the ground for the rest of the station." Well now, the audio in and out gets "grounded" as does the 12Volt power supply negative line, so ...how does one avoid this grounding problem without using a separate isolated power supply or using a battery to supply the filter itself?
Any ideas or comments?
Thanks es 73 , Dave

Hello everyone,

I have the above equipment with Kenwood TM-241a and TM-441a
radios mounted in my vehicle. Does anyone know of a way to make the
system do the cross band repeat function? This would be like the current
dual band radios are able to do.

I have not seen this listed anyplace before but hopefully someone
can steer to the correct source for this information.

Thanks everyone.

6404. ICOM 706 and automatic tuners

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-31 00:00:00 UTC
From: scoggin@delmarva.com
Message-ID: <4c6709$j1g@butthead.delmarva.com>
Source record: 207956

I just bought an Icom 706 yesterday, primarily for 6 meters - at least, until my Army MARS application is approved. I have a 100-ft end-fed long wire antenna here at work and will need an antenna tuner, preferably an automatic one.

The local ham radio store salesman was recommending an SGC-230 tuner, as opposed to the Icom AH-3 (they had both in stock). Does anyone have any experience (good or bad) with the SGC-230/Icom-706 combination?

Thanks!

I had the opportunity to visit AARS in 1991 while attending school at Bergstrom Air Force Base in Austin. Each time I visited the store was a pleasant experience.

It is also my experience that sales people "have to be perfect" in every way for SOME hams and when or if one has a bad day/week (sales person or customer for that matter) there are those few who, either via packet or internet, paste their displeasure on the monitors of those who partake of these modes.

There are some hams who actually go way out of their way to find something wrong with a ham sales establishment and end up amplifying the little things to many times their actual importance or un-importance...and they can't wait to share their negativism with the rest of us.

We are all the sum of our experiences in life... and some of us have had a better life than others. But, just because the sales people don't stand at the door in tuxedos to greet everyone with hors d'oeuvres and free gifts and the customer's name up in lights doesn't make the place a bad place to shop. After all, if EVERYONE interpreted their visit experiences as that bad....these places wouldn't be in business for very long.

Sales people are human too...just like next guy. If one has a genuine bad experience, call the owner or manager and let that person know of the experience? ...Or, run home and blast way with your keyboard phaser?

just my two cents worth...

Source record: 207968

Icom advertises that the IC-T22 can recieve AM aircraft with "a simple keypad modification." Where can I get this mod? I've looked all around the 'Net and I can't find _any_ mods for the T22. Any and all help appreciated.

6417. Need Help With Ailing TenTec Corsair(1) Rig

Newsgroup: rec.radio.amateur.equipment
Date: 1995-12-31 00:00:00 UTC
From: "Joe, VP2VBL" <tortola@caribsurf.com>
Message-ID: <4c6s4m$fom@col1.caribsurf.com>
Source record: 207969

Rig works OK on CW -- normal 100W out. SSB doesn't work -- no modulation from either mike or audio-in on rear panel. This means also can't work HF packet/RTTY/Amtor etc.

TenTec repair dept. says they don't know which board it is and told me to return rig to factory. That's fine, but from here, very expensive shipping. And with present load on repair dept., lenghty cycle.

Rig is ten years old, but I like it. It's a great CW rig.

Any suggestions (besides donating it to a public school in NYC)?

Have all the manuals. Repair facilities minimal personally and on this Island.

Thanks in advance. VP2VBL

6418. Looking for info: Johnson Viking Ranger

Hello,
I own a Drake TR7, and have the handheld Drake mic for the rig. The audio reports have been less than glowing, and the audio seems quite muddy. I get very good reports with a Turner desk mic that I have, but would like to use the handmic which at my station is more comfortable than leaning to talk into the desk mic. Could I replace the element in the mic with something else like a Heil or Shure element? I don't know much about these elements, and which would be the best overall. I don't really need the mic for DX. How much do the Heil elements go for, and would they fit into the handmic? Where is the best place to purchase the elements?
Thanks,
Chris VE6RDC

You'll need an electronic T/R switch. Ameritron sells a PIN diode
switch that works very well according to users I've run into on the
air. I think the model number is QSK-5.

>not quit enough, as VOX only opens if I yell into mic. Without transformer
>VOX would not open at all. Good enough though, I can live without VOX.

First, some of the confusion in this thread appears to result from the fact that impedance refers only to the *ratio* E/I. It does not refer to a specific voltage output or input, unless the manufacturer provides additional specifications.

Also, what do you mean by "60% of power"? Are you using a peak-reading wattmeter? If this is the indication you see on the rig's plate meter on peaks, you're probably achieving 100% output.

FWIW, my rig also has a "weak" VOX circuit, as did my previous transceiver. The problem is not the microphone. I proved this by temporarily connecting a crystal element to the input of the rig. The element overdrives the mic preamp with the gain control barely engaged, but it still won't trip the VOX reliably when I speak at a normal volume. In my case, the solution will be to modify the gain of the VOX (& perhaps Anti-VOX) op-amps for better sensitivity.

As a side note, my previous rig (Yaesu FT-101EE) used a FET-input mic preamp, so it was legitimately a high-impedance input. However, the schematic of my present transceiver shows a bipolar input stage with a 47K resistor in series with the Mic jack. By the time you read this, that resistor will be something closer to 1K and I'll be using a low impedance microphone. You might check your rig to see if it's similar. :)

Hello!
I'm interested in characteristics and perfomance of the Butternut HF-5B
"Butterfly" miniquad antenna. I will appreciate info about experiences with
that, gain, etc. I have limited space for placing a directional antenna.
Many thanks for reading this, and Happy New Year.

If you don't have windex you may use white-spirit. It will also remove
the tar-film easily.

6435. Re: LO-Z -> HI-Z mic adapter???

>I believe a hi-Z mic creates a high voltage signal with weak current.
>The transformer pumped up the low voltage signal to a high voltage
>signal, but with the loss of conversion due to K of transformer.

The impedance of the microphone does not in and of itself determine the output level. There are plenty of low-Z mics in the broadcast and recording industry that have unterminated output levels far in excess of some high-Z microphone elements. Professionally, I use them on a daily basis. Many older transmitters were designed with high-Z mic inputs such that relatively inexpensive crystal and ceramic mic elements could be used. This was necessary before active transformers became practical. A *good* audio transformer was and still is relatively expensive. The crystal mic element can be thought of as an AC voltage generator in series with a small capacitance; oftentimes less than 1500 pF. This capacitance, in series with the voltage generator can cause severe low frequency rolloff problems when the mic is terminated into anything less than a megohm. In fact, the crystal element should not be terminated with less than 10 megohms in order to realize its capable, wide frequency response.

Back to the issue at hand: I don't doubt that the inclusion of your transformer helped in your case, but another mechanism was likely the cause of your interfacing problem, unless by the very nature of your particular low-Z element, the output level is genuinely low. I haver never seen this to be the case though. Low-Z source impedances are routinely "bridged" by high-Z input impedances. Nearly every late-generation recording studio and broadcast studio's mixer microphone preamp stage incorporates a 1500 ohm input impedance that bridges the 150 source impedance of a dynamic, moving-coil microphone.

I strongly suspect that your transfomer in effect, did more to act as an isolation transformer between your mic element and your transceiver.

>If voltage from lo-Z mic was equal to a hi-Z mic, no transformer
>would have been necessary.
>Note: Lo->Hi can be ok, but Hi->Lo won't work.

Agreed. The later case will almost always require a preamp/impedance transformation.

>always work perfectly, but it the best chance you've got. :)

Excellent Advice Jack. It's generally not necessary to achieve a perfect
audio impedance match for communications audio purposes.

As long as the mic to input amp interfacing allows for adaquate level and
the frequency response of the mic element within the audio passband does
not radically change, the absolute match shouldn't matter.

I am looking for a schematic or tech manual for my Ramsey Digital Multitester Model D-2100. I contacted Ramsey Electronics and they no longer stock the manual.

Please reply to ewyspian@peganet.com

Thanks.
